CANCER is a major cause of illness in Australia and has a major impact on INDIVIDUALS, FAMILIES, and the HEALTH-CARE SYSTEM.

SURVIVAL HAS IMPROVED

In 2014, we estimate there will be 123,920 cancer cases diagnosed. The most commonly diagnosed cancers will be:

- PROSTATE (14%)
- COLORECTAL (13%)

1 in 2 Australians will develop cancer and 1 in 5 will die from it before the age of 85.

Cancers with the highest five-year survival:

- TESTICULAR (98%)
- THYROID (96%)
- LIP (93%)
- PROSTATE (93%)

BUT CHALLENGES REMAIN

In 2014, we estimate there will be 45,780 cancer deaths. The most common causes of death from cancers will be:

- LUNG (19%)
- COLORECTAL (9%)
- BREAST (7%)
- PANCREATIC (6%)

People living in AUSTRALIA diagnosed with cancer generally have better survival prospects compared with people living in other countries.
