Appendix 2 – Project scope and objectives

The following is an extract from the Schedule to the Memorandum of Understanding between the Department of Health and Ageing and the Australian Institute of Health and Welfare for the procurement of services in relation to ‘A report on the Clinical Coders, Health Information Managers and Costing Specialists (coding workforce) shortfall’.

Project description

Clinical Coding is the translation of narrative descriptions of diseases, injuries and procedures into alphanumeric codes. These codes form part of a data collection that is used for research as well as the provision of information for health service planning and financing decisions. These codes are derived from the International Classification of Diseases, tenth edition (ICD-10), developed by the World Health Organization.

With the move to ABF, it is likely that new classifications will be developed which will increase the demand for qualified members of the coding workforce.

While the issue of a shortfall in the coding workforce has been raised anecdotally in a number of national forums, no recent study has been done to quantify the scope of the shortfall or a consolidated set of recommendations to address it developed with the jurisdictions.

The schedule’s objective is to:

- conduct a survey to provide a quantifiable number of coding staff currently employed and their demographics and also identify projected numbers for the future to cover the anticipated increased demand
- produce a report on the activities currently being implemented in the jurisdictions to address these issues and
- provide recommendations on a way forward for a more consolidated national strategy to address future needs, taking into account e-health and broader developments.

Outline of the project

AIHW will provide the Department with a report on the Clinical Coders, Health Information Managers and Costing Specialist (Coding Workforce) Shortfall.

AIHW will develop the scope, content, instrument, frame estimation and validation procedures for the survey of today’s Clinical Coders, Health Information Managers and Costing Specialists workforce.

The scope of the survey is aimed at the Clinical Coders, Health Information Managers and Costing Specialists employed by hospitals and Health Departments.

The survey information collected about the future Clinical Coders, Health Information Managers and Costing Specialists workforce will need to relate to the ‘demand side’ that is the projected numbers of Clinical Coders, Health Information Managers and Costing Specialists needed to meet the anticipated expansion of coding activity. The report will include illustrative ‘what-if’ calculations of future workforce supply, based on the population characteristics gathered in the survey and on a range of assumptions about future exit/retention rates.
Appendix 3 – Survey methodology

Survey method and issues

This component of the Coding Workforce Shortfall project describes the methodology used to collect data on the coding workforce. The coding workforce has been defined by DoHA as the occupations of Clinical Coder, Health Information Manager and Costing Specialist. The survey collected data about CCs and HIMs only. The definitions of CCs and HIMs in the survey were based on the ABS standard classification of occupations (ANZSCO).

- A clinical coder is someone who assigns codes to narrative descriptions of patients’ diseases, operations and procedures in accordance with the ICD-10-AM classification to allow for storage, retrieval and analysis of health data.
- A health information manager is someone who plans, develops, implements and manages health information services, such as patient information systems, and clinical and administrative data, in order to meet medical, legal, ethical and administrative requirements of health care delivery.

To enable some comparisons over time, the definitions above, and the scope of health-care facilities in the 2010 study, align with an earlier comprehensive report on CCs and their managers, *The Australian coder workforce: 2002* (McKenzie & Walker 2003).

Data collection

Survey population

Aggregate data about hospital-based CCs and HIMs were collected via a web-based survey of coding managers employed in hospitals and day care facilities. These health-care facilities were identified via the AIHW’s Hospital Morbidity Database (AIHW HMDB) which formed the population frame for the survey. The characteristics and activity data for each facility were also extracted and matched by facility to the survey data. This enabled the coder resources (the workforce) to be analysed in combination with a measure of the required volume of clinical coding work (health facility separations).

The survey targeted some 1,170 health establishments with admitted patients in 2008–09 and for which morbidity data had been provided to the AIHW HMDB.

Data for each facility were collected by approaching one person working at the facility, either the coding manager or supervisor, to take part in the survey. Many of the people in these roles were responsible for more than one health facility, and were asked to complete more than one survey form. Given this, the survey questionnaire was kept as short as possible, while still obtaining the necessary information (see Attachment 1).
Survey preparation

Respondent contact

The survey email and follow-up email dispatches, the secure survey site and technical operations were outsourced. Being a web-based survey, the operation required a list of email addresses for contacts in each health facility and because one did not already exist, considerable time and resources were invested in compiling it. State and territory health departments provided support, supplying where they were able, administrative information about public sector facilities. This was used as a base which was supplemented by contact information obtained by 'cold' calls by telephone. Similarly, DoHA provided some contact information about the private sector facilities and this was supplemented with information obtained by telephone. In addition to this activity, the HIMAA and CCSA sent an email, alerting their members to the survey and encouraging their support. This resulted in further additions to the list of contacts from HIMs in both private and public sector facilities.

All hospital contact email addresses were checked by sending an email to each contact, confirming their details and determining all facilities for which they were responsible for clinical coding. The email also contained an explanation of the survey, its purpose, importance and how the data would be used.

Questionnaire

A draft questionnaire was designed to meet the identified data requirements and provided to a small cross-section of clinical coding managers/HIMs for feedback. Before being finalised, the questionnaire and supporting explanatory information were also reviewed by state-based colleagues with expertise in collecting similar data.

Enumeration

The survey was conducted over 5 weeks (from 23 April to 28 May 2010) during which time, query resolution and respondent support was provided by the AIHW team.

Maximising response

All methods of encouragement to participate were important to the final overall response because participation in the survey was voluntary. Pre-survey, the task of compiling the email contact list also served as preparation for gaining a good response to the survey. The email which was sent to facility contacts explaining the purpose of the survey and the importance of quality, reliable results, also established personal links with the AIHW which was important to enlisting survey support. The information which was distributed to all HIMAA and CCSA members was to raise awareness of the survey, but also to enhance support for its completion.

During the survey, response was monitored by state, sector and peer group in order to target follow-up activity and minimise bias in the final data set. Reminder emails were sent to contacts approximately 2 weeks and 3 weeks after the initial survey emails. In addition, targeted follow-up by telephone focused on contacts responsible for multiple facilities because, being geographically clustered, their non-participation was more likely to skew the results. The telephone follow-up was undertaken both by AIHW and colleagues in the state and territory health departments.
Final response

Responding facilities
The overall response to the survey was 75%. Response from public facilities was 86% and from private facilities, 61%. The distribution by jurisdiction, sector and peer group is shown below (Table 16).

Non-responding facilities
There were 96 public and 196 private facilities which did not respond to the survey. For public facilities the distribution across peer group and the proportion of separations they represented in 2008–09 are shown in Table 17. Peer group and hospital separations are not available for private facilities.
Overall, the non-responding facilities had 10.9% of total separations in 2008–09 and this was evenly distributed across peer groups (at around 1% or less) except for principal referral hospitals which had 6.4% of total separations. However, the total number of principal referral hospitals (both responding and non-responding) account for 64% of the total separations across all public facilities in the survey and, although only 7 out of 71 of them did not respond, this appears relatively high in the separations figures when they are actually well represented at the peer group level.

Survey estimation

When evaluating whether to estimate for missing survey data in the coding workforce survey, two aspects were examined: population estimation (which accounts for units missing from the population of interest) and imputation (which can reduce the level of item non-response, that is, when respondents provide partially completed questionnaires).

Population estimation is designed to be part of the data processing for a sample survey in which the sample has been scientifically selected before the survey is conducted. It involves applying an expansion factor to each responding unit using known data about the entire population. This enables an estimate of the whole population (not just the respondents) to be produced when aggregate output is generated.

In the coding workforce survey, coding managers for all hospitals/day care facilities within the scope of the survey were sent questionnaires and technically, it was a census. However, not every coding manager responded and the result is a data set based on a very large ‘self-selecting sample’ of the population. Consequently, the group of facilities in the data set is not a random
selection and the usual measures of variability in survey results (standard errors) are not a suitable means of gauging the reliability of results.

A non-random respondent group also results in some bias in the group's response and underlying characteristics, and the estimation process can only adjust for characteristics which are known for the entire population. Characteristics which are known only for respondents, including any bias in them, will be expanded by the estimation process and not change to any skewness in their profile.

Regarding imputation, the questionnaires received had very little missing information and this could be managed through standard data editing and cleaning.

In summary, survey estimation is not a suitable path because the responding population is not random. Further, because of the very high response to the survey overall and the very low incidence of partially completed questionnaires, the need for estimation is low and would not enhance either the data set or the analysis.

Data collection issues

Before collecting data about CCs and HIMs, the following methodological and operational issues needed to be addressed:

- identifying the target population
- double counting coders
- scope of the data collection
- reference period.

Further, the options for addressing these issues were limited by the time constraints associated with the overall project.

Identifying the target population

As a workforce, CCs have some characteristics which make them difficult to count accurately. An individual Clinical Coder can work in more than one health-care facility, and in both the private and public sectors. Most do this by working as employees of multiple facilities, while others are employees of contract coding companies or are self-employed. HIMs however, seem to move between facilities to a lesser extent, making them easier to measure as a group.

Unlike some other occupations in the health sector, such as nurses, there is no national register of CCs or HIMs. There is a professional association for each of these occupations; however, not all people employed in these professions are members of the associations.

Therefore, the way to find members of the coding workforce needed to be via the health-care facilities for which they code. It was recognised that the most detailed information would be obtained by individually identifying and surveying all CCs and HIMs. However, this was assessed as being not feasible within the project timeline. Instead, one person in each health-care facility was contacted to provide information about all the CCs for that facility. That person was the coding manager or supervisor, and usually an HIM.

The major difficulty with this approach was avoiding double counting coders working in more than one facility or those contracted who would be identified at the facility and through the company employing them.
Double counting

By conducting a facility-based survey, double counting CCs was inevitable because of the highly mobile/flexible way in which they work. In order to limit the double counting, the survey of health facilities included CCs who were employees and excluded CCs working for contract coding companies. The latter group were identified through their employer and excluded from the count for any facility for which they coded.

Overall, some CCs (mainly hospital employees) were counted more than once, while others (self-employed contract CCs) were excluded from the count. Therefore, an FTE figure has been calculated from their hours worked in order to provide a measure which accounts for the double counting.

However, some estimation of the 'headcount' of workers has been included to enable their characteristics as a group to be examined. The figures were difficult to produce from the survey and are based on a manual filtering of survey data aimed at removing duplicates. Headcounts in Tables 1 and 5 must be considered estimates of counts because it is possible not all duplicates were removed.

Scope of the data collection

Clinical Coders

Information was collected by survey about CCs employed by health-care facilities and by five large private agencies which contract out their clinical coding services. All CCs employed by health facilities were in-scope for the survey. CCs employed by small coding businesses were excluded because of the project time constraints. Also generally excluded were self-employed, single coder operations unless they were identified as being the only coder for a facility.

Health Information Managers

Health Information Managers working in health facilities and directly in the coding (and related) processes were in-scope. People work as HIMs in a much larger range of agencies than CCs, including all levels of government and health insurance companies. For the purposes of this project, the work performed by HIMs who are not employed in health facilities or are not directly involved in the coding process, is assumed to be ‘secondary’, or indirect involvement, rather than ‘primary’, or direct involvement, in the clinical coding processes. That is, they may use the data resulting from the clinical coding that occurs in health facilities but have no involvement in the clinical coding process itself. These HIMs were excluded from the coding workforce profile in this report.

Health facilities

To enable some comparisons over time, information collected for the 2010 survey of health facilities was based on the same scope as the 2002 study of CCs by McKenzie and Walker (2003). That is, hospitals/day care facilities which supply unit record morbidity data to their respective state/territory health departments. Facilities which did not have beds/admitted patients, such as community-based care, were excluded from the frame. The rationale was that they were unlikely to have CCs on staff and the time and resources would be better used in targeting facilities which did.
Further, health facilities with beds/admitted patients were a focus of the study in order to compare the volume of coding work (using health facility separations data) with the FTE numbers in the workforce who were undertaking the clinical coding.

**Reference period**

Data on health-care facility separations, which have been used in the analysis of survey data, were obtained from administrative sources. The most recent administrative data available relate to the 2008–09 financial year and in order to align with this, the survey reference period was also the 2008–09 financial year.

**Limitations of the survey data**

Conducting a survey of health facilities rather than a survey of CCs and HIMs, has effects on the utility of the data. First, a headcount of CCs and HIMs is very difficult to produce from the data because of the extremely mobile nature of the work. Second, the aggregate data by facility which was collected does not allow the characteristics of the coding workforce to be cross-tabulated, limiting the data to broad level analysis, only. Third, comparisons with earlier surveys are limited because the collection unit in earlier data was the CCs themselves, as well as their managers.

To minimise the headcount problem, some filtering of the survey results has enabled an estimate to be produced for each state and territory. However, it is likely that not all the double counting was adjusted and the figures should be treated as estimates only.

To enable some quantification of the workforce load, a derived FTE figure has been used for the main analysis. The FTE was produced by

\[
\text{Estimated total hours} \div 38 \text{ hour ‘standard week’}.
\]

Monthly hours were collected in the survey because coding hours per week fluctuate considerably, due to the monthly coding deadlines. The standard week was converted to a monthly figure by using a ‘46-week year’, to adjust for leave periods and public holidays.

It should be noted that some information reported in the survey, such as hours worked, will have been estimated rather than based on records.
Attachment 1: Survey questionnaire

Coding Workforce Survey

The information captured in this survey relates to all employees in your health facility who are clinical coders and health information managers actively involved in the production of coded data, including yourself. The definitions used for this survey are below, as defined in the ANZSCO workforce codes.

A clinical coder is someone who assigns codes to narrative descriptions of patients' diseases, operations and procedures in accordance with the ICD-10-AM classification to allow for storage, retrieval and analysis of health data.

A health information manager is someone who plans, develops, implements and manages health information services, such as patient information systems, and clinical and administrative data, in order to meet medical, legal, ethical and administrative requirements of health care delivery.

The survey excludes:

1. clinical coders engaged from external coding contractors; and
2. health information managers not working in a coding-related role.

Some people undertake tasks which relate to both clinical coding and health information management and for this survey they should be assigned to the occupation in which they worked the most hours.

If you are responsible for providing coding services for more than one hospital or day procedure facility, you will need to complete a separate survey form for each facility. There should be a link below for each facility you have been identified as responsible for. If this list is not correct, please contact Vicki Bennett at Vicki.bennett@aihw.gov.au urgently.

- Name of Facility 1
- Name of Facility 2 etc

(continued)
**Coding Workforce Survey**

**Please confirm this is the name of the facility for which you are filling out this form.**

Facility name (auto-populated)

- [ ] Yes
- [ ] No

If no, please list the name of the hospital or day procedure facility

Please note: data will be produced as aggregate statistics only, and individual facilities will not be identified in the analysis or the reporting of results

---

(continued)
## Coding Workforce Survey

1. Including yourself, but excluding clinical coders from external contracting companies, how many employees (including casual/non-ongoing staff) were clinical coders and health information managers at 30 June 2009?

   *Include people who are not primarily coders but who do coding work. As well as people doing clinical coding work, include people involved in related activities, such as coding audits and training coders.*

<th>Health Information Manager positions</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTE</td>
<td>FTE</td>
</tr>
</tbody>
</table>

8 During the financial year ending 30 June 2009, did you utilise any external clinical coding services supplied by contracting companies?

☐ Yes
☐ No

9. The following question is for private hospitals and day procedure facilities, only:

**Beds and/or chairs**

How many beds are available in your facility?

For day hospital facilities, include chairs, trolleys, recliners and cots which are used mainly for post-treatment recovery purposes.

Please use the space below to provide any comments and/or recommendations you may have about shortages in the coding workforce or other related issues that you would like to contribute to the analysis and planning of the future coding workforce.
Attachment 2: Detailed supplementary tables

Coding Workforce Survey

In this report, estimating the size of the coding workforce focuses on the FTE measure because workers are highly mobile and many work in more than one health-care facility. The FTE measure takes account of the known double counting of workers who were employed in more than one facility. However, a 'headcount' of workers enables their characteristics as a group to be examined and, in order to provide a broad level profile, Table 18 presents estimates based on survey data which have been filtered at the facility level. Responses to survey questions and respondents’ comments were examined individually and CCs found to be reported against more than one facility were reassigned to just one.

The figures are estimates only, because it is possible that not all duplicates were removed. As well, the figures do not include any estimate of worker numbers employed in facilities which did not respond to the survey. It should be noted too, that these estimates exclude self-employed contract coders because they were out of scope of the survey. The resulting figures appear to be underestimations of the headcount. For this reason, the percentage distribution is shown, rather than counts, because it provides a more reliable overview of workforce characteristics and, with the high survey response, it is reasonable to assume that the CCs and HIMs in the responding group were a fair representation of the overall workforce employed in health facilities.

The data presented in Table 19 through to Table 22 relate to the characteristics of responding health-care facilities in the survey. The tables are based on counts of facilities and their characteristics. Staff numbers are presented as FTE measures in order to account for double counting (see introduction above); coding staff figures were calculated from hours worked and vacant positions were collected as FTEs in the survey.

Census

Notes on Census data

In the 2001 ABS Census, occupation data were classified to the ABS ASCO, 2nd edition, whereas the 2006 census data were coded to ANZSCO, a newer classification which enables coding of much more detailed occupations. However, there was no change to the Coding Clerk or HIM occupations and data from the two Census years are comparable. From both classifications, the occupation of Coding Clerk is used in the tables below and is defined as the specialisation of Medical Record Clerk and Clinical Coder combined. Separate figures for Clinical Coders are not available.

In each Census there is a relatively small proportion of respondents who do not supply enough information to determine a precise occupation. There are also respondents for whom an occupation cannot be coded. These factors result in an undercount of people in individual occupations. Counts of persons in an occupation may vary from one table to the next and therefore, totals may not be the same in all tables. Reasons for this include a variation in response rates to individual questions, resulting in some persons being excluded from analysis, and the ABS routinely applies small random changes to cells in order to protect confidentiality; this leads to small differences in total values between tables.

Appendix 4 – Future workforce projection calculations

There is no simple formula for projecting the coding workforce requirements for the future as there are a significant number of factors, many of which are not yet well established, that will influence both the supply of and demand for these workers. Individual health services will differ in their ratios of CCs, HIMs and CSs due to variation in their funding models, specialty profile, volume of services, location, and how the services are managed locally.

For the purposes of this report, a number of different calculations have been undertaken estimating the additional number of coders required due to a range of anticipated changes in the health sector as outlined in Section 3 of this report. These include:

- growth in separations due to an ageing population and rising chronic disease levels
- implementation of ABF for admitted and non-admitted hospital services
- e-health implementation impacts
- national health reform, including the establishment of LHNs.

Baselines and assumptions

For the purposes of calculating the workforce needs for the future a number of assumptions and baselines need to be set. These are not definitive, and could be changed given any further information or decisions about how policies are to be implemented, but they do provide a basis on which to make the calculations outlined below. The assumptions are as follows.

- A 5-year period from 2009–10 to 2013–14 to project the workload increases and changes
- All figures are reported as whole numbers
- Annual coding hours/year/FTE equivalent coder has been calculated using the following methodology:
  - annual coding hours = 38 hours/week x 46 working weeks/year = 1,748 hours
- Historical numbers of separations and OOS, as published in the Australian Hospital Statistics
- A coding throughput rate of 4 records per hour, based on the results of this survey (see Table 31), which is slightly lower that the rate of 4.3 calculated in the 2002 report (McKenzie & Walker 2003)
- An attrition rate of 5% per annum has been used, based on the average coder turnover rate in Queensland Health of 5.3% per annum over the previous 5 years.

No assumptions have been made for the impact of expanded roles based on health reform changes.
Calculations

Inflows expected = 1,792 people

Although it was found that 50.1% of the coding workforce surveyed are currently working part-time and that this figure has continued to rise over the previous 8 years (see Figure 10), there is no current estimation of how many hours these staff are working. Thus it is not possible to estimate the number of FTE equivalent coders that the subsequent calculations will add to the workforce requirements, but it can be assumed to be less than the number of people trained.

Additional HIMs = 300 people

Due to the decrease in the number of academic institutions providing training in HIM, it is assumed that the number of HIMs graduating each year will remain substantially unchanged without further intervention. Thus for the purposes of this report, the calculation of new HIMs is as follows:

\[2 \text{ university programs each graduating 30 students/year x 5 years} = 300 \text{ HIMs}.\]

Additional CCs = 1,492 people

HIMAA and OTEN have both demonstrated some growth in the number of new coders trained over the proceeding decade (see Figure 7), with a combined average growth rate of 16.6% in the previous 5 years. If it is assumed that this growth is maintained at the current rate the number of additional CCs trained over the next 5-year period would be \(1,492\) people (Table 30).

Outflows expected = 316 people

With 51.8% of the existing coding workforce over the age of 45 years (see Table 12), and with this figure increasing over the preceding 8 years, as well as almost two-thirds of all those learning to code commencing at age 40 years or over (Figure 9), it can be expected that there will be significant attrition in the coding workforce over the next 5 years. This may be due to retirement, or a reduction in hours as coders move towards retirement, but over a 15-year period it would be expected that approximately 50% of the existing workforce will have retired.

Table 5 estimates the current FTE coders as 897.4, with an additional 177.4 FTE vacancies, giving a current national figure of 1,075 FTE coders and HIMs. Given the supplementary role of contract coders, and the small non-response rate to the survey, the figure calculated below, based on the number of FTE staff required to code the number of annual separations nationally of 1,265 FTEs, seems a reasonable estimate (see calculation below).

Using a conservative attrition rate of 5% per annum, as per the Queensland Health report, the numbers of coders leaving the workforce can be calculated as follows:

\[1,265 \text{ FTEs x 5\% x 5 years} = 316 \text{ FTEs}.\]

This makes no estimation of the potential impact of reduced work hours or outward migration.

FTEs required to meet current and future needs = 3101 (high) or 1,757 (low)

Staffing required to code the existing episodes of care = 1,265 FTEs

Using the national average separations coded/hour calculated from this study as 4, and the hours worked by a coder coding full-time in a year as 1,748, an FTE coder is assumed to code 6,440 separations per year, i.e.:
4 records x 38 hours x 46 weeks = 6,440 records coded per year.

Given the total number of separations for 2008–09 was 8,148,448, the total number of FTEs required to code this number of separations is calculated as:

8,148,448 separations /6,440 separations per FTE = 1,265 FTEs.

Staffing required to code the anticipated increase in admitted episodes of care = 193 FTEs

Over the period 2001–02 to 2008–09 there was, on average, a 3.5% increase each year in the number of hospital separations nationally (see Table 30 and Figure 14). Assuming this trend continues to be relatively stable, the 2008–09 figure of 8,148,448 will have risen to 9,677,800 by 2013–14; an increase of 285,196 separations in the first year, rising to 327,269 additional separations requiring coding in the fifth year.

This current trend line is assumed to be sufficient to adjust for future population ageing, increased incidence of chronic disease and increased utilisation of services.
Using the figure calculated above for the number of records coded per year per FTE coder as 6,440, Table 30 below shows the numbers of FTE coders required in 2009–10 as 1,310 growing to 1,503 by 2013–14. Even if there is no change in the environment, this equals an additional 193 coders required over the next 5 years.

**Staffing required for ABF of OOS= 1,493 (high) or 149 (low)**

From 2003–04 to 2007–08 there were on average 31,323,335 OOS per year nationally with no apparent increase or decrease in these numbers over the 5 years (Figure 15), thus for the purposes of this analysis, the number of OOS is assumed to remain constant into the future.
The following calculations are based on the assumption that each OOS takes 5 minutes to code, that is, 12 OOS can be coded per hour. This assumption is made based on expert coder advice.

High range calculations
Assuming that all OOS will require coding:

\[
\frac{31,323,335 \text{ OOS}}{12 \text{ records per hour}} = 2,610,278 \text{ hours of coding time} \\
1 \text{ FTE coder} = 1,748 \text{ hours per year} \\
\text{To code all OOS} = \frac{2,610,278}{1,748} = 1,493 \text{ FTEs.}
\]

Low range
If OOS coding is automated in some way or is undertaken by clinical staff, and only a sample of records are ‘checked’, for example 10%, the number of extra FTEs required may only be 149. However, it would probably follow that the skill level of this group may need to be higher as they would be performing an auditing function.

E-health implications and LHN = 150 FTEs
In the Queensland Health report is was assumed that an additional 30 FTEs would be required, based on two FTE staff per health service district, for implementation of expanded roles around e-health and technology and the implementation of ABF. This includes an extra four FTEs for corporate and state-wide functions.

Using the Queensland figures as a model, and based on the fact that Queensland delivers approximately 20% of the total national separations, the additional FTEs required nationally could be calculated as:

\[
30 \times 5 = \text{150 FTEs.}
\]
However, this may be a low end estimation if the new unit of ABF, performance reporting and e-health management will be the LHN, as proposed in the NPA. The number of staff required will be dependant on the number of LHNs created, which is anticipated to be larger than the existing number of districts/area health services.

**Increased staffing levels for ABF on admitted patients = ?**

Due to the national roll-out of ABF, the focus on the quality and accuracy of the coded data will be increased. This can already be seen in the number of jurisdictions who have outlined plans to commence state-based audits, and the introduction of coding auditor and educator roles. The increased requirement for auditing, reporting and education will create a need for more skilled coders with extended responsibilities.

Victoria provides an existing case study of a coding workforce that has adapted to the use of coded data for case-based payment. The high level of qualifications of those undertaking coding (>75% of all coding performed by HIM university graduates) (Figure 3), and investment made in auditing and education, may be an indication of the need that the other jurisdictions will face with the implementation of ABF. This is will be a significant challenge given the current decline in the number of HIM graduates.

Appendix 5 – Existing education and training courses

Health Information Management courses

Undergraduate degree courses
Previously, four tertiary undergraduate Health Information Management programs were delivered in Australia at the following institutions:

• La Trobe University, Victoria
• Curtin University of Technology, Western Australia
• Queensland University of Technology, Queensland
• University of Sydney, New South Wales.

From 2011 onwards, undergraduate qualifications in Health Information Management will only be delivered by Curtin University of Technology in Western Australia, and through a double degree program at La Trobe University in Victoria, as follows:

• Curtin University of Technology
  - Bachelor of Health Science (Health Information Management major)
  - This is a 3-year degree program that is available for study both on-campus and via distance.
• La Trobe University
  - Bachelor of Health Sciences and Master of Health Information Management
  - This is a 4-year double degree program only in on-campus mode
  - Bachelor of Information Systems/Master of Health Information Management
  - This is an integrated double degree program completed over 4 years, only in on-campus mode.

Postgraduate courses
From 2011 onwards the following postgraduate courses will be available:

• Curtin University of Technology
  - Masters of Science (Health Information Management)
    2 years full-time on-campus or via distance
• La Trobe University
  - Masters of Health Information Management
    2 years full-time only in on-campus mode (with plans for online delivery).
Other universities, such as QUT, now offer some health information units as part of postgraduate programs in Health Services Management and Health Science. An increasing number of Health Informatics programs have also commenced at various universities around the country, but these do not contain clinical coding training components.

**Clinical coding courses**

Education and training in clinical coding are provided as either a course component of a broader HIM qualification, or as a course in its own right. Courses currently delivered, or planned for implementation in 2011, are outlined below.

**Postgraduate courses**

- Curtin University of Technology
  - Graduate Certificate in Clinical Classification: 1 semester full-time internal or fully external course. The entry requirements are bachelor’s degree and formal medical terminology training or 2 years relevant work experience
  - Postgraduate Diploma in Clinical Classification: 1 year full-time internal or fully external course. The entry requirements are bachelor’s degree or Graduate Certificate of Clinical Classification and Medical Terminology.
- La Trobe University
  - Graduate Diploma in Clinical Coding: planned for commencement in the near future.

The Queensland University of Technology offered a Graduate Certificate in Health Science (Clinical Classification) in 2010 but this has been discontinued from 2011 because of lack of enrolments.

**Vocational level courses**

- HIMAA
  
  Himaa Education Services provide a range of courses approved under the Australian Qualifications Framework via distance education, both nationally and internationally. These include:
  - Comprehensive Medical Terminology – approximately 240 hours of study
  - Introductory ICD-10-AM, ACHI and ACS – approximately 170 hours of study to obtain a Statement of Attainment at the Certificate III level
  - Intermediate ICD-10-AM, ACHI and ACS clinical coding – approximately 70 hours of study to obtain a Statement of Attainment at the Certificate IV level
  - Advanced ICD-10-AM, ACHI and ACS clinical coding – approximately 250 hours of study to obtain a Statement of Attainment at the Certificate IV level. Students who successfully complete this course are also able to undertake an additional examination to obtain the Clinical Coder Certification (CCC)
  - Special Courses/Workshops – HIMAA can also provide fast-tracked (structured) comprehensive medical terminology and introductory clinical coding courses that use the same course content as the courses outlined above but are designed and packaged to meet specific client’s needs.
• OTEN
  - Basic coder training
  - OTEN is currently developing a 'study skills package' that will include Interpret and Apply Medical Terminology Appropriately and Produce Coded Clinical Data competencies which should be available in the second half of the year. This course is run through NSW TAFE, and is also offered by distance education. Students obtain a Statement of Attainment at the Certificate III level. OTEN does not plan to offer the higher level coding units at this point; only this first introductory subject as part of this short course to help students get started in the field of clinical coding.

• La Trobe University
  - Short course in Clinical Coding Auditing – this course has been designed to develop skills in the auditing of coded data, and in analysing, reporting and acting on the audit outcomes
  - ICD-10-AM Coding Refresher Course – this course aims to refresh skills and knowledge for those who have previously undertaken coder training but have been out of the workforce for some time.

• Other providers
  - QUT has offered short courses for Queensland Health staff in the past, using a model which included workplace practical experience in additional to face to face instruction
  - NCHIRT and NCCH provide short courses in coding under contract to various organisations on an ‘as needs’ basis.

Other coding training is often conducted ‘in-house’ or through continuing professional education sessions provided by employers, or by other consultant private training providers.

Appendix 6 – American academic pathways examples

Source: AHIMA 2010.
Appendix 7 – Apprenticeship information

What is an apprenticeship?

An apprenticeship or traineeship is a training contract between an employer and an employee in which the apprentice or trainee learns the skills needed for a particular occupation or trade (Skills Victoria 2010). Australian Apprenticeships provide staff with relevant hands-on experience, skills and knowledge through structured (on-the-job and off-the-job) training. Unlike full-time university or college, apprentices and trainees are paid a wage while undertaking their qualification (Queensland Apprenticeship Services 2008).

Australian Apprenticeships encompass all apprenticeships and traineeships. They combine time at work with training and can be full-time, part-time or school-based.

Australian Apprenticeships are available in a variety of certificate levels in more than 500 occupations across Australia, in traditional trades, as well as a diverse range of emerging careers in most sectors of business and industry, including community services and health.

Benefits to the employer

The Australian Government has introduced a number of initiatives to assist employers who take on an Australian Apprentice, particularly where the Australian Apprenticeship is in a trade experiencing a skills shortage. These initiatives provide financial incentives to eligible employers through the Australian Apprenticeships Incentives Program.

Employers of an Australian Apprentice may be eligible for financial assistance through:

- standard, additional and special incentives
- support for adult Australian Apprentices
- assistance for Australian Apprentices with disability
- support for employing a school-based Australian Apprentice
- securing Australian Apprenticeships
- Apprentice Kickstart Extension.

An employer of an existing worker who becomes an Australian Apprentice may attract incentives for a Certificate III, IV or Diploma or Advanced Diploma level qualification where:

- the employee is articulating from an Australian Apprenticeship at the Certificate II level to an Australian Apprenticeship at the Certificate III or IV level (within 12 months)
- the postcode of the employer’s workplace and the qualification the Australian Apprentice is undertaking are eligible to attract the special Rural and Regional Skills Shortage commencement incentive; or
- the training contract, as declared by the relevant state/territory training authority specifies that the expected/nominal duration of the Australian Apprenticeship is 2 years or more (part-time employment is prorated).
The eligibility of existing workers to attract incentives also depends on the prior qualifications they hold and whether the Australian Apprentice meets the eligibility requirements of the program.

Employers may attract the standard commencement incentive of $1,500 for existing workers undertaking a Certificate III, IV or Diploma or Advanced Diploma level qualification. In addition, employers may be eligible to receive the standard completion incentive of $2,500 for an Australian Apprentice who successfully completes a Certificate III, IV or Diploma or Advanced Diploma level qualification where the expected/nominal duration of the Australian Apprenticeship is 2 years or more.

Benefits for the employee

Apprenticeships are the best way to combine training and employment and they can lead to a nationally recognised qualification.

Australian Apprenticeships are available to anyone of working age and do not require any entry qualifications. Applicants can be a school-leaver, re-entering the workforce or simply wishing to change careers.

Australian Apprenticeships offer:

- a great way to get a head start in a chosen career
- paid work and structured training that can be on the job, off the job or a combination of both
- ‘competency-based’ training which means trainees can complete their training faster if they reach the required skills level
- recognition of existing skills and prior experience and course credit granted, potentially reducing formal training time
- availability as full-time or part-time (also available part-time in many schools)
- nationally recognised qualifications and skills which provide the basis for further education and training over the course of a working life
- a pathway from school to work.

Australian Apprentices also may be eligible for income support through Youth Allowance, Austudy or ABSTUDY. More information is available from Centrelink <http://www.centrelink.gov.au/internet/internet.nsf/individuals/st_index.htm> (Centrelink 2010).

National Skills Needs List (NSNL)

The National Skills Needs List (NSNL) identifies trades that are deemed to be in national skills shortage based on research conducted by the Department of Education, Employment and Workplace Relations.

This list is used to determine eligibility for the following Australian Government initiatives:
• Support for Adult Australian Apprentices
• Tools For Your Trade payment
• Rural and Regional Skills Shortage incentive
• Securing Australian Apprenticeships initiative (The Australian Government 2010a).

Types of apprenticeship/traineeship options

In the past, apprenticeships focused on traditional trades and training took at least 3 years to complete. Traineeships, by comparison, covered a much wider range of occupations but the training was shorter, lasting between 1 and 2 years.

Over the last decade, however, the distinction between apprenticeships and traineeships has blurred with many higher level and longer traineeships being introduced. Apprenticeships and traineeships are now referred to nationally as Australian Apprenticeships, although some states and territories still make a distinction.

There are numerous types of Australian Apprenticeships that can be implemented (training.com.au 2010).

Australian school-based apprenticeship

Australian school-based apprenticeship is a mix of vocational, technical and academic education and training and paid employment. It allows students to complete their schooling while starting their Australian Apprenticeship, and get a head start on their career path where they can obtain a senior secondary certificate and credits towards a vocational qualification.

These apprenticeships at an Australian Technical College allow students in Years 11 and 12 to:
• start an apprenticeship while still at school
• participate in a combination of school, paid work and on- and off-site training
• progress towards gaining a nationally recognised qualification
• work towards completing their Year 12 Certificate
• develop business skills
• keep open the option of further education and training.

Australian Technical Colleges are based in all states and territories across Australia with further details at <http://www.deewr.gov.au/Schooling/australiantechnicalcolleges/Pages/contacts.aspx> (DEEWR 2010).

Full-time Australian Apprenticeships

Employing an Australian Apprentice full-time means that the employer is responsible for all the on-the-job training. In consultation with the apprentice, the employer is able to choose a training provider for the off-the-job training and determine a flexible training plan to suit the business needs.

Part-time Australian Apprenticeships

Many small to medium sized organisations choose to employ Australian Apprentices part-time. The Australian Apprenticeship/Traineeship Training Contract requires that the Australian
Apprentice receives a guaranteed pattern of work. This means employers must provide a minimum number of hours of on- and off-the-job training per week. The exact time of these requirements vary. In Queensland, for example, the total time spent training at work and with the registered training organisation (RTO) must be at least 15 hours per week.

**Group training organisations**

Group training organisations (GTOs) allow employers to employ an Australian Apprentice as they need them. The GTO acts as the 'primary employer' of Australian Apprentices and 'contracts' them out to businesses. GTOs may place an Australian Apprentice with more than one business over the life of that Australian Apprentice training contract, offering more flexibility to small businesses.

**Existing staff**

Existing staff may enter an Australian Apprenticeship. An existing worker is defined as an employee who has been with a business for more than 3 months full-time, or 12 months part-time, or casual. This gives employers the opportunity to upgrade the skills of existing employees who they know and trust with the further benefits of:

- being eligible for Australian Government funding
- a shorter training period due to recognition of previously acquired training, skills and on-the-job experience resulting in cost-effective, targeted training for the business.

Australian Government funding is available for existing employees if they can demonstrate a significant training requirement and:

- are commencing a Certificate III or IV where the full-time training duration is 2 years or more
- are commencing a Certificate III or IV and are eligible for Rural and Regional Skill Shortages commencement incentive of $1,100
- have completed a Certificate II Australian Apprenticeship with the business and commence Certificate III or IV training within 12 months of doing so.
Appendix 8 – Draft international curriculum for HIMs

This draft curriculum is being developed under the auspices of the International Federation of Health Records Organizations (IFHRO), the international body that supports national associations to implement and improve health records and the systems which support them. It is affiliated with the WHO.

• Legal aspects of health information |  |

| **Domain XI: Clinical Classification Systems** | 1. Implement and manage applications and processes for clinical classification and coding  
2. Apply the correct uses of classifications, nomenclatures, and terminologies  
3. Accurately assign codes in compliance to standards  
4. Apply knowledge in coding quality audits |
| --- | --- |
| • Coding principles and Skills  
• Classification and nomenclature systems  
• Clinical vocabularies and terminologies  
• Retrieval and Abstraction of health information  
• Classification of disease and operations |  |

| **Domain XII: Reimbursement Methodologies** | 1. Understand various payment systems  
2. Manage the use of clinical data required in reimbursement systems |
| --- | --- |
| • Payment systems  
• Financial systems  
• Reimbursement management |  |

| **Domain XIII: Health Services Organization and Delivery** | 1. Communicate and apply standards related to accreditation, licensure, and certification related to health information  
2. Understand the healthcare organization’s functions and delivery  
3. Analyze and respond to health information needs |
| --- | --- |
| • Structure and functions of healthcare system  
• Accreditation, certification, licensure standards  
• Health care organization and resources |  |
## Domain XIV: Health care Privacy, Confidentiality, Legal and Ethical Issues

| Health and medical laws                      | 1. Promote ethical standards of practice |
| Health information laws, regulations, and standards | 2. Manage access and disclosure of health information |
| Confidentiality and release of information   | 3. Interpret and comply to country’s legal and regulatory requirements in relation to health information services |
| Data privacy and security                    | 4. Enforce data privacy and security     |
| Ethical issues in medical documentation      |                                           |
| Policies and Procedures                      |                                           |
