# Terminology

The change in primary screening test for the National Cervical Screening Program (NCSP) from a Pap test to an HPV test with partial genotyping and reflex LBC triage has led to the introduction of new terminology and new concepts. Key terms and concepts are defined.

**Cervical screening:** This term describes the process of screening for the prevention of cervical cancer. The term 'HPV screening' should not be used.

**Cervical Screening Test (CST):** The agreed term to describe the screening test of the renewed NCSP, which is an HPV test with partial genotyping and a reflex LBC test if this is indicated by the result of the HPV test.

**Co-test:** This term indicates that an HPV test and LBC are both performed on the sample, irrespective of the result of the HPV test.

**Follow-up episode:** Is a term that encompasses a follow-up HPV test and an LBC if this is required.

**HPV:** This term is used to indicate oncogenic HPV, which are the types of HPV associated with cervical cancer.

**HPV test:** Performed as part of the screening round to test for the presence of oncogenic HPV types; this is defined as either a screening HPV test when it is part of the screening episode, or a follow-up HPV test if it is performed 12 months or 24 months after the screening episode (this is also sometimes referred to as a repeat HPV test). An HPV test is also performed to test for the presence of oncogenic HPV types as part of a **co-test**.

**HPV test result:** An HPV test result will be reported as detected or not detected in line with molecular testing terminology (where detection levels are based on a set threshold) rather than HPV positive or HPV negative. The high-level HPV test result groupings are:

- HPV 16/18 detected
- Oncogenic HPV (not 16/18) detected
- Oncogenic HPV not detected
- Unsatisfactory (test cannot be performed due to technical reasons).

**Negative co-test:** A single cervical sample for which oncogenic HPV is not detected and LBC is reported negative.

If more than one sample is collected and tested on the same day, none of these samples can have oncogenic HPV or a cytological abnormality detected.

Negative HPV is defined as an HPV test result of 'oncogenic HPV not detected'.

Negative cytology is defined as a cytology test result where the squamous cell component is '*S1 Cell numbers and preservation satisfactory. No abnormality or only reactive changes*' and there is no endocervical (glandular) abnormality.

That is, a cytology test where the squamous cell component is '*S1 Cell numbers and preservation satisfactory. No abnormality or only reactive changes*', and the endocervical (glandular) component is '*E0 No endocervical component*', '*E1 Endocervical component present. No abnormality or only reactive changes*', '*EU Due to the unsatisfactory nature of the cytology specimen, no assessment has been made*', or '*E- Not applicable: vault smear/previous hysterectomy*').

**Reflex test:** LBC test following an HPV test that detected oncogenic HPV.

**Risk of significant cervical abnormality:** There are three risk classifications:

- participants who are classified at **low risk** will be invited to re-screen in five years.
- participants who are classified at **intermediate risk** will be invited to have a follow-up HPV test in 12 months, and then a second follow-up HPV test in another 12 months if they remain at intermediate risk (at which time they move to either low risk or higher risk depending on test results).
- participants classified at **higher risk** will be referred directly to colposcopy for further investigation.

**Screening episode:** Is a term that encompasses a primary screening HPV test and a reflex LBC if this is required. Is also referred to as a primary screening episode in this document.

**Screening round:** Covers the entire screening pathway for a participant from their primary HPV test through to a final screening outcome; a screening round is only completed when a participant returns to routine 5 yearly screening, or has either a cervical abnormality detected that requires treatment or a diagnosis of cervical cancer.

**Self-collected sample:** A vaginal sample taken by a participant. This sample can only be used for an HPV test (a sample needs to be collected by a practitioner if the HPV test result indicates that an LBC test is required to ascertain risk of of significant cervical abnormality).

# 1 Introduction

## 1.1 National Cervical Screening Program

The National Cervical Screening Program (NCSP) is a highly successful public health initiative in Australia, halving cervical cancer incidence and mortality since it was introduced in 1991. This has been achieved through organised, population-based cervical screening to detect precancerous changes to cervical cells, allowing treatment before any progression to cervical cancer, thereby preventing this disease. Until December 2017, cervical screening involved 2-yearly Pap tests, which was supported by high-quality cervical cytology through pathology laboratories, and by state and territory cervical cytology registers, that supported appropriate recommendations for clinical management, and provided a safety net to people who participated in cervical screening by sending reminders about screening and follow-up.

Improvements in technology, a greater understanding of the role of human papillomavirus (HPV) in the development of cervical cancer, and the introduction of an HPV vaccine that is administered to girls and boys under the National Immunisation Program, led to the NCSP being reviewed and 'renewed', to ensure that the NCSP continued to provide Australians with safe and effective cervical screening.

As a result of this process, on 1 December 2017, a renewed NCSP was introduced that included a change from 2-yearly Pap tests for the target age group 20–69 to 5-yearly Cervical Screening Tests (CST) for the target age group 25–74. A CST is a human papillomavirus (HPV) test, followed by a liquid-based cytology (LBC) test if oncogenic (cancer-causing) HPV is found.

A further change was the collection of cervical screening data by the National Cancer Screening Register (NCSR), which is now the sole source of cervical screening data, and as such has taken over responsibility for sending reminders about screening and follow-up.

## 1.2 Development of the National Cervical Screening Program data dictionary

The development of the first data dictionary for the NCSP started when NCSP program managers and data managers saw the implementation of *Screening to prevent cervical cancer: guidelines for the management of asymptomatic women with screen-detected abnormalities* (NHMRC 2005) as an opportunity to standardise data collections across jurisdictions through the development of a national cervical screening data dictionary.

The then-called *Standardised cervical screening data dictionary* was originally developed as three sub-sets; the first sub-set comprised data items related to demographic information for program participants, practitioners, and laboratories as well as cytology and HPV testing results, and was published on the Department of Health (Health) website in April 2007. The second sub-set comprised data items for procedures for obtaining histology specimens and reporting of histology codes. The third sub-set was developed concurrently with the incorporation of the three sub-sets into a single document and comprised definitions and algorithms for the performance indicators reported nationally in the annual monitoring report for the NCSP, *Cervical Screening in Australia*.

At an NCSP program managers meeting held in June 2008, it was decided that the dictionary should be further developed into a comprehensive document, comprising *Essential*, *Desirable* and *Aspirational* data elements to support the NCSP as a whole. The original

dictionary was expanded into the *National cervical cancer prevention data dictionary* in July 2008, with the final data dictionary published in 2014.

This data dictionary promoted and supported national consistency in state and territory data collection and national reporting by the Australian Institute of Health and Welfare (AIHW) for the NCSP until 30 November 2017.

Work on a new data dictionary commenced in 2015, soon after the onset of the renewal process for the NCSP, as it was seen as a key document to support data collection and reporting for the renewed program. The *National Cervical Screening Program data dictionary version 1.0* was developed by the AIHW with the assistance of state and territory cervical screening programs, and the National Cervical Screening data dictionary working group, with additional input into specific elements of the data dictionary provided by the NCSP Quality and Safety Monitoring Committee, the Colposcopy Working Group convened to progress the collection and reporting of colposcopy data in the renewed NCSP, and cervical screening experts Professor Ian Hammond, Professor Marion Saville, Professor Julia Brotherton, Professor David Roder and Professor Dorota Gertig.

Following a lengthy development process alongside other key documents, including the clinical management guidelines, quality framework, a form for the collection of colposcopy data, and NPAAC standards for pathology laboratories reporting cervical screening tests, the *National Cervical Screening Program data dictionary version 1.0* was endorsed by the Standing Committee on Screening in February 2017 and published on 25 May 2017.

While the early development of this data dictionary was key to the successful implementation of the renewed NCSP on 1 December 2017, because the data dictionary predated the renewed NCSP, it was recognised that the data dictionary would need to be reviewed and updated periodically in the future to ensure it continues to align with and support data and reporting for the renewed NCSP.

The *National Cervical Screening Program data dictionary version 1.1* was the result of the first process to revise and update the data dictionary in line with the renewed NCSP. This update included a major review of all data items with requisite changes made to data items to reflect the renewed NCSP and the data collected by the NCSR. This update of the data dictionary also reflected a change to the screening pathway for intermediate risk participants, effective from 1 February 2021, which meant that intermediate risk participants could remain at this risk level for 24 months instead of 12 months. This update again occurred with the assistance of state and territory cervical screening programs through the National Cervical Screening Program data dictionary working group and the NCSP Program Management Committee (PMC). The *National Cervical Screening Program data dictionary version 1.1* was endorsed by the NCSP PMC on 5 May 2022 and released by the AIHW on 10 May 2022.

This current *National Cervical Screening Program data dictionary version 1.2* is the result of the second process to revise and update the data dictionary in line with the renewed NCSP, specifically to incorporate changes following the 1 July 2022 expansion of the eligibility criteria for self-collection of vaginal samples to include all participants, rather than only those who are under-screened or never screened. This update was undertaken with the assistance of state and territory cervical screening programs through the National Cervical Screening Program data dictionary working group, the NCSP PMC, and the Department of Health and Aged Care.

Endorsement of changes to Performance Indicators in the *National Cervical Screening Program data dictionary version 1.2* was provided by the NCSP Quality and Safety Monitoring Committee on 18 May 2023.

The *National Cervical Screening Program data dictionary version 1.2* was endorsed by the NCSP PMC on 26 May 2023.

The *National Cervical Screening Program data dictionary version 1.2* was endorsed by the Department of Health and Aged Care on 26 May 2023, following NCSP PMC endorsement.

The *National Cervical Screening Program data dictionary version 1.2* was released by the AIHW on 30 May 2023. It supersedes the *National Cervical Screening Program data dictionary version 1.1*.

## **1.3 Role of the National Cervical Screening Program data dictionary**

The *National Cervical Screening Program data dictionary* is a key document that has been developed to support AIHW monitoring and reporting for the renewed NCSP, although it has been recognised that this document will support the renewed NCSP and its operation more broadly, including ensuring consistency in data collection and reporting between the AIHW and the state and territory cervical screening programs.

As the primary purpose of this data dictionary is to support monitoring and reporting by the AIHW for the renewed NCSP, only key data items required for this purpose, along with selected others considered important to support the renewed NCSP more broadly are included in this data dictionary.

Many more data items exist in the NCSR that are either not provided to the AIHW or do not support AIHW reporting and are therefore not included in this data dictionary.

## 2 Summary of updates to the National Cervical Screening Program data dictionary

This chapter summarises the updates made to this current *National Cervical Screening Program data dictionary version 1.2* compared to *version 1.1*.

### Terminology

Where appropriate, the term ‘people’ has been replaced with the term ‘participants’ or ‘invitees’ when referring to cervical screening data. Participants and invitees may include women, transgender men, intersex people, and non-binary people.

The term ‘females’ is used for cancer, mortality, and population data, as these data are based on sex recorded at birth. However, it should be noted that some people may not identify with this term.

### Eligibility for self-collection

Eligibility to self-collect a sample for HPV testing has changed.

Up until 30 June 2022, only people aged 30 or over who had never participated in cervical screening or were 2 or more years overdue for cervical screening, and who declined a practitioner-collected sample, were eligible to self-collect a vaginal sample for HPV testing.

On 1 July 2022, these eligibility criteria were removed, allowing all participants to self-collect their sample for HPV testing.

This means that anyone who is eligible for cervical screening (people with a cervix aged 25–74 years who have ever been sexually active) is now also eligible for self-collection, and should be offered the choice of HPV testing on a self-collected vaginal sample or on a clinician-collected sample.

### Data items

New and revised data items are detailed in Table 2.1 and Table 2.2.

**Table 2.1: New data items**

Data item (version 1.2)	Definition	Reason for addition
J5 Primary screening episode participant risk of significant cervical abnormality	Primary screening episode risk of significant cervical abnormality of a participant.	Capturing the primary screening episode participant risk which is highly relevant to changes to the intermediate risk screening pathway.
J11 First follow-up episode participant risk of significant cervical abnormality	First follow-up episode risk of significant cervical abnormality of a participant.	Capturing the first follow-up episode participant risk which is highly relevant to changes to the intermediate risk screening pathway.
J13 Second follow-up episode commencement date	The date the second follow-up episode commenced.	New data item specific to the second follow-up episode.
J14 Second follow-up episode completion date	The date the second follow-up episode was completed.	New data item specific to the second follow-up episode.

(continued)

**Table 2.1: New data items (continued)**

<b>Data item (version 1.2)</b>	<b>Definition</b>	<b>Reason for addition</b>
J15 Second follow-up episode result	The second follow-up episode result is a combination of an HPV test and an LBC test (where this is performed), where the HPV test is a repeat HPV test performed 12 months after the first follow-up episode.	New data item specific to the second follow-up episode.
J16 Second follow-up episode test risk of significant cervical abnormality	Risk of significant cervical abnormality determined from a second follow-up episode result, comprised of a primary HPV test with partial genotyping and LBC triage.	New data item specific to the second follow-up episode.
J17 Second follow-up episode participant risk of significant cervical abnormality	Second follow-up episode risk of significant cervical abnormality of a participant.	New data item specific to the second follow-up episode.
J18 Second follow-up episode recommendation	The appropriate management based on the second follow-up episode risk of significant cervical abnormality of a participant.	New data item specific to the second follow-up episode.

**Table 2.2: Revised data items**

<b>Data item</b>		<b>Reason for change</b>
<b>Version 1.2</b>	<b>Version 1.1</b>	
A1 Participant identifier	A1 Participant identifier	Guide for use restricted to cervical screening invitees and participants.
B1 Family name	B1 Family name	Collection methods and Comments updated.
B2 Given name	B2 Given name	Collection methods and Comments updated.
B3 Other given names	B3 Other given names	Collection methods and Comments updated.
B5 Sex	B5 Sex	Data item updated to reflect changes made between the candidate and the final METEOR identifier 741686.
B6 Gender	B6 Gender	Data item updated to reflect changes made between the candidate and the final METEOR identifier 741842.
B7 Indigenous status	B7 Indigenous status	Definition changed from 'Whether a person identifies as being of Aboriginal and/or Torres Strait Islander descent' to 'Whether a person identifies as being of Aboriginal and/or Torres Strait Islander origin'.
B10 CALD status	B10 CALD status	Guide for use expanded to include additional background.
D1 HPV vaccination clinical completion status	D1 HPV vaccination clinical completion status	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.
D2 HPV vaccination clinical completion date	D2 HPV vaccination clinical completion date	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.
D3 HPV vaccine dose date	D3 HPV vaccine dose date	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.
D4 HPV vaccination dose age	D4 HPV vaccination dose age	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.
D5 HPV vaccine implied dose number	D5 HPV vaccine implied dose number	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.
D6 HPV vaccine type	D6 HPV vaccine type	Comments expanded to describe change from 3-dose to 2-dose to single-dose HPV vaccination schedule.

(continued)

**Table 2.2: Revised data items (continued)**

Data item		Reason for change
Version 1.2	Version 1.1	
F1 Correspondence type	F1 Correspondence type	Correspondence types E1 Exit letter, F0 Follow up, and G0 deleted to limit to correspondence types to only invitations and reminders to screen and invitations and reminders to rescreen. Guide for use restricted to correspondence sent to invitees and participants.
I8 Cytology test result	I8 Cytology test result	Definition of 'Negative' changed from I5 = S1 and I6 = (E- or E0 or E1) to I5 = S1 and I6 = (EU or E- or E0 or E1). Definition of 'Any glandular abnormality' clarified by the addition of I5 = SU or S1 or S2 or S3 or S4 or S5 or S6 or S7 to the existing I6 = E2 or E3 or E4 or E5 or E6. Guide of use expanded to note that source of cytology test result categories is the clinical guidelines.
H3 HPV test specimen site	H3 HPV test specimen site	Comments added that self-collected samples should have an HPV test specimen site of B2 'Vaginal' rather than B1 'Cervical'.
H8 HPV test medium	H8 HPV test sample	Name changed to align with NCSR data dictionary.
J3 Primary screening episode result	J3 Primary screening episode result	Guide for use and Comments updated.
J4 Primary screening episode test risk of significant cervical abnormality	J4 Primary screening episode risk of significant cervical abnormality	Name and definition changed to reflect that this is the risk of significant cervical abnormality based on test results alone.
J6 Primary screening episode recommendation	J5 Primary screening episode recommendation	Numbering change. Definition changed to reflect that this is based on primary screening episode participant risk.
J7 First follow-up episode commencement date	J6 Follow-up episode commencement date	Name and numbering change. Guide for use updated to be specific to first follow-up episode. Comments note change to screening pathway for intermediate risk participants.
J8 First follow-up episode completion date	J7 Follow-up episode completion date	Name and numbering change. Guide for use updated to be specific to first follow-up episode. Comments note change to screening pathway for intermediate risk participants.
J9 First follow-up episode result	J8 Follow-up episode result	Name and numbering change. Guide for use updated to be specific to first follow-up episode. Comments note change to screening pathway for intermediate risk participants.
J10 First follow-up episode test risk of significant cervical abnormality	J9 Follow-up episode risk of significant cervical abnormality	Name and numbering change. Guide for use updated to be specific to first follow-up episode. Name and definition changed to reflect that this is the risk of significant cervical abnormality based on test results alone. Guide for use updated to note that test risk is not adjusted for participants who were overdue for screening by at least 2 years prior to their intermediate risk screening episode, are Aboriginal and/or Torres Strait Islander, or are aged 50 or older when assigning a test risk of significant cervical abnormality. Comments note change to screening pathway for intermediate risk participants.
J12 First follow-up episode recommendation	J10 Follow-up episode recommendation	Name and numbering change. Guide for use updated to be specific to first follow-up episode. Definition changed to reflect that this is based on follow-up episode participant risk. Comments note change to screening pathway for intermediate risk participants.
M11 Test of cure completion flag	M11 Test of cure completion flag	Definition of cytology component of a negative co-test changed from S1 and (E0 or E1) to S1 and (E0 or E1 or EU or E-).
M12 Test of cure completion date	M12 Test of cure completion date	Definition of cytology component of a negative co-test changed from S1 and (E0 or E1) to S1 and (E0 or E1 or EU or E-).

## Performance indicators

Revised performance indicators are detailed in Table 2.3.

**Table 2.3: Revised performance indicators**

Performance indicator	Outline of change
Indicator 1 Participation	No substantive change. Definition wording updated to 'eligible females' to clarify that only females with a cervix are included in the denominator. Participation specifications updated to clarify primary screening and follow-up HPV tests for the numerator. Coverage specifications added. 'People' changed to 'participants'.
Indicator 2 Response to invitation	No substantive change. Definition wording updated. Specifications updated to clarify correspondence types for the denominator and primary screening HPV tests for the numerator. 'People' changed to 'invitees'.
Indicator 3 Rescreening	Rescreening time frames for early, appropriate, and late adjusted. Appropriate rescreening split into two time frames to allow more detailed analysis of rescreening. Definition wording updated. Specifications updated to clarify primary screening HPV tests for the numerator and denominator. 'People' changed to 'participants'.
Indicator 4 Screening results	No substantive change. Definition wording updated. Specifications updated to clarify primary screening episodes for the numerator and denominator. 'People' changed to 'participants'.
Indicator 5 Correlation of screening results	No substantive change. Definition wording updated. Denominator updated to 'Primary screening episode results' to reflect correlation of results. Specifications updated to clarify primary screening episodes for the denominator. H5 HPV test result – oncogenic corrected to J3 Primary screening episode result. 'People' changed to 'participants'.
Indicator 6 Screening HPV test positivity	No substantive change. Definition wording updated to 'valid screening HPV tests' to clarify that only valid tests are included, and to 'oncogenic HPV' to clarify that only oncogenic HPV is included. Specifications updated to clarify valid primary screening HPV tests for the numerator and denominator. 'People' changed to 'participants'.
Indicator 7 Cervical cancer diagnosed after a low risk screening test result	No substantive change. Definition wording updated. Specifications updated to clarify primary screening HPV tests for the denominator. Rationale updated. 'People' changed to 'participants'.
Indicator 8 LBC test in self-collection participants positive for oncogenic HPV (not 16/18)	Indicator name changed from 'Self-collection participants positive for oncogenic HPV (not 16/18) who have an LBC test within 6 months'. Definition wording updated. Calculations and specifications updated to be measured within 3 months and within 6 months. Age group expanded from 30–74 to 25–74 to reflect removal of criteria for self-collection from 1 July 2022. Specifications updated to clarify primary screening HPV tests for the numerator and denominator. 'People' changed to 'participants'.
Indicator 9 Colposcopy in self-collection participants positive for oncogenic HPV 16/18	Indicator name changed from 'Self-collection participants positive for oncogenic HPV 16/18 who have a colposcopy within 6 months'. Definition wording updated. Calculations and specifications updated to be measured within 3 months and within 6 months. Age group expanded from 30–74 to 25–74 to reflect removal of criteria for self-collection from 1 July 2022. Specifications updated to clarify primary screening HPV tests for the numerator and denominator. 'People' changed to 'participants'.
Indicator 10 Adherence to recommendation for follow-up	Definition wording updated and split into (a) screening episodes and (b) follow-up episodes. Rationale updated to include both screening episodes and follow-up episodes. Second calculation added for follow-up episodes. Calculation for disaggregation of numerator removed. 'People' changed to 'participants'.
Indicator 11 Follow-up results	Definition wording updated. Rationale updated to include first follow-up episodes and second follow-up episodes. Second set of calculations added for second follow-up episodes. Addition of 'intermediate risk' to Numerator specifications to reflect current screening pathway in which participants can remain at intermediate risk at first follow-up HPV test. 'People' changed to 'participants'.

(continued)

**Table 2.3: Revised performance indicators (continued)**

<b>Performance indicator</b>	<b>Outline of change</b>
Indicator 12 Colposcopy rate	Definition wording updated. Rationale wording updated to include both screening episodes and follow-up episodes. Calculation for follow-up episodes split into calculations for first follow-up episode result that indicates higher risk and second follow-up episode result that indicates higher risk. 'People' changed to 'participants'.
Indicator 13 Time to colposcopy	Definition wording updated. Rationale wording updated to include both screening episodes and follow-up episodes. Calculation for follow-up episodes split into calculations for first and second follow-up episode result that indicates higher risk. 'People' changed to 'participants'.
Indicator 14 Biopsy rate	No substantive change. Definition wording updated. 'People' changed to 'participants'.
Indicator 15 Yield of high-grade abnormalities on biopsy among participants who attend colposcopy with higher risk screening results	No substantive change. Definition wording updated to include both screening episodes and follow-up episodes. 'People' changed to 'participants'.
Indicator 16 Positive predictive value of colposcopy	No substantive change. Definition wording updated to include both screening episodes and follow-up episodes. 'People' changed to 'participants'.
Indicator 17a High-grade cervical abnormality detection rate	No substantive change. Denominator updated. 'People' changed to 'participants'.
Indicator 17b Cervical cancer detection rate	No substantive change. Definition wording updated. Denominator updated. 'People' changed to 'participants'.
Indicator 18 Cervical cancers diagnosed by time since last screen	No substantive change. Definition wording updated.
Indicator 19 Incidence of cervical cancer	No substantive change. Definition wording updated.
Indicator 20 Mortality from cervical cancer	No substantive change. Definition wording updated.

## 3 Data items

### 3.1 Data item specifications

The data items in the *National Cervical Screening Program data dictionary* are described and defined using a standard metadata format that is designed to ensure that each data item is clear, concise, unambiguous, comprehensive and provides sufficient information to ensure all those who collect, provide, analyse, and use the data understand its meaning.

The format is consistent with that of AIHW's Metadata Online Registry (METeOR), which would allow these items to be imported into METeOR in the future.

#### Identifying and definitional attributes

Identifying and definitional attributes include the name and definition of the data item, as well as its collection status within the NCSP. Collection status reflects the importance of the data item to the collection, and can be *Essential*, *Desirable* or *Aspirational*. There are also *Conditional* data items, whose inclusion depends on criteria for this data item being met. Essential data items are mandatory for collection; conditional data items may be mandatory, desirable, or aspirational.

#### Value domain attributes

Representation class refers to the form of the data item, such as identifier, text, date, or code. The data type refers to the type of symbol, character or other designation used to represent the data item (for example, string, date/time, number, text), and the format and character length describe how the value should appear for that data item.

Formats can be alphabetic character (denoted by the letter A), numeric (denoted by the letter N) alphanumeric (denoted by the letter X), or specific to dates (D for day, M for month, Y for year). Characters that are not in brackets denote a value that must be represented. Round brackets are used to indicate the number of repeats if a character is repeated more than 6 times in succession (X(9) indicates 9 alphanumeric characters). Square brackets are used to indicate that characters are optional in any ordered combination ([XXX] indicates 0, 1, 2 or 3 alphanumeric characters). Curly brackets are used to indicate that characters are entirely optional (X{XX} indicates 1 or 3 alphanumeric characters).

#### Value domain format examples

**X(10)** – No square/curly brackets, therefore exactly 10 alphanumeric characters must be entered.

**{X(10)}** – Curly brackets, therefore optional with fixed length. Either 0 or exactly 10 alphanumeric characters must be entered.

**[X(10)]** – Square brackets, therefore optional with variable length – either 0 or between 1 to 10 alphanumeric characters entered.

**X[X(39)]** – At least 1 alphanumeric character is required (an X is outside any square/curly brackets) and optionally supports an additional 0 to 39 alphanumeric characters, which means the maximum total length is 40 alphanumeric characters.

**{N(10)[N]}** – Curly brackets, therefore optional with fixed length. Either 0 or 10 numeric characters with a further optional single numeric character entered. This allows for 0, 10 or a maximum of 11 numeric characters.

**{AAX[XXX]}** – Curly brackets, therefore optional with fixed length. Either 0 or 2 alphabetic characters followed by a single alphanumeric character with a further optional 0 to 3 alphanumeric characters

allowed. This allows for 0, 3, 4, 5 or a maximum of 6 characters (2 alphabetic, and 4 alphanumeric). If only 3 characters are entered, then they must be 2 alphabetic followed by 1 alphanumeric.

See tables 3.1 and 3.2 for further examples of the use of codes and brackets.

Collection and usage attributes may be included to ensure that data are captured correctly and to aid in the correct interpretation of permissible values.

### Data item attributes

This section of the data item may also include a guide for use, which takes the form of additional comments or advice on interpretation or application, and collection methods, which are comments and advice concerning the capture of data for a particular data item.

Additional information relates to source, reference documents, as well as an indication of whether this is a new data item, or whether it supersedes a data item in the previous data dictionary.

**Table 3.1: Data item format – codes**

Code	Definition	Description	Example
A	Alphabetic	Supports letter characters (including punctuation) only (that is, no numbers)	AAA = ABC not A1C
N	Numeric	Supports numeric digits only (that is, no alphabetic characters)	NNN = 123 not 1B3
X	Alphanumeric	Supports both alphabetic characters (including punctuation) and numeric digits	XXX = ABC or 123 or A1C or 1B3
D	Day	Date specific: day number within a month. Represented as DD in DDMMYYYY date format	23rd day of August 2013 <u>23</u> 082013
M	Month	Date specific: month number within a year. Represented as MM in DDMMYYYY date format	8th month of 2013 23 <u>08</u> 2013
Y	Year	Date specific: year number. Represented as YYYY in DDMMYYYY date format.	2013th year 2308 <u>2013</u>

**Table 3.2: Data item format – use of brackets**

Bracket type	Description	Example	Notes
No square or curly brackets	Characters must be entered in the format presented. <i>Note:</i> number in round brackets ( ) represents characters repeated 7 or more times in succession.	AAA	Exactly 3 alphabetic characters
		NN	Exactly 2 numeric characters
		X(8)	Exactly 8 alphanumeric characters
Curly brackets /braces { }	Characters are optional, but if entered, they are fixed in length and must match exactly the format presented.	{AAA}	0 or exactly 3 alphabetic characters
		{NN}	0 or exactly 2 numeric characters
		{X(8)}	0 or exactly 8 alphanumeric characters
Square brackets [ ]	Characters are optional, but if entered are variable in length up to the maximum length designated	[AAA]	Either 0, 1, 2 or 3 alphabetic characters
		[NN]	Either 0, 1 or 2 numeric characters
		[N(8)]	Either 0, 1, 2, 3, 4, 5, 6, 7 or 8 numeric characters

## 3.2 Structure of data items

The following table provides an overview of the data items in this version of the *National Cervical Screening Program data dictionary*. It also maps current data items to their previous number, where data items have been retained across the versions.

Data items are arranged into two main groups – Participant data items which either do not change or do not change very often, and screening pathway data items that will be added to a participant’s record each time they screen. This is illustrated in Table 3.3.

**Table 3.3: Data item structure**

	Associated groups
<b>Participant</b>	Group A: Participant identifier data items
	Group B: Participant data items
	Group C: Participant status data items
	Group D: Participant vaccination status data items
	Group E: Participant demographic data items
<b>Screening pathway</b>	Group F: Correspondence data items
	Group G: Test type data item
	Group H: HPV test data items
	Group I: Cytology test data items
	Group J: Screening episode data items
	Group K: Colposcopy data items
	Group L: Histology test data items
	Group M: Treatment data items
	Group N: Provider data items
	Group O: Pathology laboratory data items
	Group P: Screening history data items

### 3.3 Summary of data items

The following table provides a summary of the data items in the data dictionary, arranged as 'Participant' data items and 'Screening pathway' data items. To aid in transition from the previous versions of the data dictionary, the number of each data item is shown alongside the number in the previous data dictionaries.

**Table 3.4: Summary of data items**

<i>Participant</i>		<i>Version 1.2</i>	<i>Version 1.1</i>	<i>Version 1.0</i>	<i>Pre- renewal</i>
<b>Group A</b>	<b><i>Participant identifier data items</i></b>				
	Participant identifier	A1	A1	A1	A1
	Previous participant identifier	A2	A2	A2	..
	Medicare card number	A3	A3	A3	A2
	Individual healthcare identifier	A4	A4	A4	A3
<b>Group B</b>	<b><i>Participant data items</i></b>				
	Family name	B1	B1	B1	A4
	Given name	B2	B2	B2	A5
	Other given names	B3	B3	B3	..
	Date of birth	B4	B4	B4	A7
	Sex	B5	B5	B5	..
	Gender	B6	B6	..	..
	Indigenous status	B7	B7	B6	A8
	Main language other than English spoken at home	B8	B8	B8	A9
	Country of birth	B9	B9	B7	A10
	CALD status	B10	B10	B9	..
<b>Group C</b>	<b><i>Participant status data items</i></b>				
	Defer flag	C1	C1	..	..
	Reason to defer screening	C2	C2	C2	..
	Defer start date	C3	C3	C3	..
	Defer end date	C4	C4	C4	..
	Opt out flag	C5	C5	..	..
	Reason for opt out	C6	C6	..	..
	Opt out date	C7	C7	C5	..
	Opt in date	C8	C8	C6	..
	Hysterectomy flag	C9	C9	C7	A21
	Date of hysterectomy	C10	C10	C8	A22
	Death flag	C11	C11	C9	A24
	Date of death	C12	C12	C10	A25
	DES exposed	C13	C13	..	..
	Immunocompromised	C14	C14	..	..

Test of cure completion date	M12	M12	M12	..
<b>Group N Provider data items</b>				
Medicare provider number of provider requesting a test	N1	N1	N1	B1
Healthcare provider identifier – individual (HPI-I) of provider requesting a test	N2	N2	N3	B2
Healthcare provider identifier – organisation (HPI-O) of provider requesting a test	N3	N3	N2	B3
Australian state/territory of provider requesting a test	N4	N4	N5	B10
Australian postcode of provider requesting a test	N5	N5	N6	B11
Medicare provider number of provider collecting a specimen	N6	N6	..	..
Non-medical provider number of provider collecting a specimen	N7	N7	N7	B13
Healthcare provider identifier – individual (HPI-I) of provider collecting a specimen	N8	N8	N9	B14
Healthcare provider identifier – organisation (HPI-O) of provider collecting a specimen	N9	N9	N8	B15
Type of provider collecting a specimen	N10	N10	N10	B12
Australian state/territory of provider collecting a specimen	N11	N11	..	..
Australian postcode of provider collecting a specimen	N12	N12	..	..
<b>Group O Pathology laboratory data items</b>				
Pathology laboratory identifier	O1	O1	O1	L1
Pathology laboratory name	O2	O2	O2	..
Pathology laboratory accession number/identifier	O3	O3	O3	C1
Pathology laboratory Australian state/territory	O4	O4	..	..
Pathology laboratory Australian postcode	O5	O5	..	..
<b>Group P Screening history data items</b>				
Previously screened flag	P1	P1	P1	..
Date of last screening test	P2	P2	P2	..
Last screening test type	P3	P3	P3	..
Number of days since last screening test	P4	P4	P4	..

## 3.4 Data items

A1 Participant identifier.....	23
A2 Previous participant identifier.....	24
A3 Medicare card number.....	26
A4 Individual healthcare identifier.....	27
B1 Family name.....	29
B2 Given name.....	30
B3 Other given names.....	31
B4 Date of birth.....	32
B5 Sex.....	33
B6 Gender.....	37
B7 Indigenous status.....	41
B8 Main language other than English spoken at home.....	46
B9 Country of birth.....	49
B10 CALD status.....	51
C1 Defer flag.....	54
C2 Reason to defer screening.....	55
C3 Defer start date.....	56
C4 Defer end date.....	57
C5 Opt out flag.....	58
C6 Reason for opt out.....	59
C7 Opt out date.....	61
C8 Opt in date.....	62
C9 Hysterectomy flag.....	64
C10 Date of hysterectomy.....	65
C11 Death flag.....	66
C12 Date of death.....	67
C13 DES exposed.....	68
C14 Immunocompromised.....	70
D1 HPV vaccination clinical completion status.....	73
D2 HPV vaccination clinical completion date.....	75
D3 HPV vaccine dose date.....	77
D4 HPV vaccine dose age.....	78
D5 HPV vaccine implied dose number.....	79
D6 HPV vaccine type.....	81
E1 Residential address.....	84
E2 Residential suburb/town/locality.....	85

E3 Residential alternative or other names for suburb/town/locality .....	86
E4 Residential Australian state/territory .....	87
E5 Residential Australian postcode.....	88
E6 Residential geocode – latitude.....	89
E7 Residential geocode – longitude.....	90
E8 Residential geocode – quality .....	91
E9 Residential SA1.....	92
F1 Correspondence type .....	94
F2 Correspondence date.....	96
F3 Correspondence method.....	97
F4 Correspondence failure flag .....	98
F5 Correspondence failure date.....	99
F6 Correspondence failure type .....	100
G1 Type of test.....	102
H1 HPV test date.....	104
H2 HPV test collection method.....	105
H3 HPV test specimen site.....	106
H4 Reason for HPV test .....	107
H5 HPV test result – oncogenic HPV .....	108
H6 HPV test result – secondary oncogenic HPV .....	110
H7 HPV test type .....	112
H8 HPV test medium .....	114
H9 HPV test batch information – Control kit lot number.....	115
H10 HPV test batch information – Control kit expiry date .....	116
H11 HPV test batch information – Cellular (LBC) extraction kit lot number.....	117
H12 HPV test batch information – Cellular (LBC) extraction kit expiry date .....	118
H13 HPV test batch information – Nucleic acid extraction kit lot number .....	119
H14 HPV test batch information – Nucleic acid extraction kit expiry date .....	120
H15 HPV test batch information – Amplification kit lot number.....	121
H16 HPV test batch information – Amplification kit expiry date .....	122

## **Group A: Participant identifier data items**

- A1 Participant identifier
- A2 Previous participant identifier
- A3 Medicare card number
- A4 Individual healthcare identifier

---

## A1 Participant identifier

---

### Identifying and definitional attributes

<i>Data item name</i>	Participant identifier
<i>Definition</i>	Participant identifier unique within the National Cervical Screening Register.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Identifier
<i>Data type</i>	String
<i>Format</i>	X[X(19)]
<i>Maximum character length</i>	20

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	This data item is used to uniquely identify cervical screening invitees and participants who exist on the National Cervical Screening Register
<i>Collection methods</i>	Assigned by the National Cervical Screening Register.

#### Relational attributes

<i>Related metadata reference</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> A1 Client identifier
-----------------------------------	--

---

---

## A2 Previous participant identifier

---

### Identifying and definitional attributes

<i>Data item name</i>	Previous participant identifier
<i>Definition</i>	Participant identifier unique within the state or territory cervical screening register from which the record has been migrated to the National Cervical Screening Register.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Identifier
<i>Data type</i>	String
<i>Format</i>	[X(20)]
<i>Maximum character length</i>	20

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>This data item only applies to participants who have been migrated from a state or territory cervical screening register to the National Cervical Screening Register.</p> <p>Therefore, it only applies to 'legacy participants' within the National Cervical Screening Register, and not to new participants within the National Cervical Screening Register.</p>
<i>Collection methods</i>	<p>When the National Cervical Screening Register migrated participants from a state or territory cervical screening register, it was important that the participant identifier as it appeared on that register was also migrated.</p> <p>There needed to be the capacity to collect more than one A2 for an individual in the National Cervical Screening Register, as there are participants who appeared on more than one state or territory cervical screening register that were migrated to a single A1 Participant identifier in the National Cervical Screening Register, either because a single record was sent by pathology laboratories to more than one state or territory cervical screening register, or because these participants resided in more than one state or territory over their screening history.</p> <p>This means that each individual on the National Cervical Screening Register will have zero, one, or many A2 fields, and all these possibilities needed to be able to be captured by the National Cervical Screening Register.</p>

*Comments*

To prevent a situation whereby participants from different registers have the same identifier, and to avoid losing information about the state or territory from which the participant was migrated, the identifier and state or territory both need to be recorded. To do this, the source state or territory of the record (which is not necessarily the state or territory in which the participant resides) was used as a prefix to the previous participant identifier.

For example, a participant identifier of 123456789 that was migrated from a New South Wales register became NSW123456789.

---

## A3 Medicare card number

---

### Identifying and definitional attributes

<i>Data item name</i>	Medicare card number
<i>Definition</i>	A numeric number on a medical card allocated by Medicare Australia for the purpose of identifying those people eligible for specific services.
<i>Collection status</i>	Desirable

### Value domain attributes

---

<i>Representation class</i>	Identifier
<i>Data type</i>	Number
<i>Format</i>	{N(10)[N]}
<i>Maximum character length</i>	11

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	Full Medicare number for an individual (that is, family number plus person (individual reference) number), or truncated Medicare number.
<i>Comments</i>	<p>The Medicare card number is printed on a Medicare card and is used to access Medicare records for an eligible person.</p> <p>Up to 9 persons can be included under the one Medicare card number with up to five persons appearing on one physical card. Persons grouped under one Medicare card number are often a family, however, there is no requirement for persons under the same Medicare card number to be related.</p> <p>A person may be shown under separate Medicare card numbers where, for example, a child needs to be included on separate Medicare cards held by their parents. As a person can be identified on more than one Medicare card this is not a unique identifier for a person.</p> <p>Note: Veterans may have a Medicare card number and a Department of Veterans' Affairs (DVA) number or only a DVA number.</p>

#### Collection and usage attributes

<i>Guide for use</i>	
<i>Collection methods</i>	A full history of names should be retained. Do not delete or overwrite a previous given name. Where a person uses multiple names, these should all be recorded to increase the ability to undertake data linkage.
<i>Comments</i>	Often people use a variety of names, including legal names, married/maiden names, nicknames, assumed names, traditional names, etc. Even small differences in recording - such as the difference between Thomas and Tom - can make Record linkage impossible. To minimise discrepancies in the recording and reporting of name information, agencies or establishments should ask the person for their full (formal) Given name and Family name. These may be different from the name that the person may prefer the agency or establishment workers to use in personal dealings. Agencies or establishments may choose to separately record the preferred name that the person wishes to be used by agency or establishment workers. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies or establishments should always ask the person to specify their first given name and their family or surname separately. These should then be recorded as Given name and Family name as appropriate, regardless of the order in which they may be traditionally given.

#### Collection and usage attributes

<i>Guide for use</i>	<p>The terms sex and gender are interrelated, and are often used interchangeably, however they are distinct concepts:</p> <ul style="list-style-type: none"><li>• Sex is understood in relation to sex characteristics. Sex recorded at birth refers to what was determined by sex characteristics observed at birth or in infancy.</li><li>• Gender is about social and cultural differences in identity, expression and experience.</li></ul> <p>While they are related concepts, caution should be exercised when comparing counts for sex with those for gender.</p> <p>‘The preferred Australian Government approach is to collect and use gender information. Information regarding sex would ordinarily not be required and should only be collected where there is a legitimate need for that information and it is consistent with Australian Privacy Principle 3. (AGD 2015).</p> <p>The permissible values are based on the Australian Bureau of Statistics Standard for sex, gender, variations of sex characteristics and sexual orientation variables (ABS 2021). The values are defined as follows:</p> <p>CODE 1 Male</p> <p>Persons whose sex at birth or infancy was recorded as male, or who reported their sex as male at the time of collection.</p>
----------------------	---

#### CODE 2 Female

Persons whose sex at birth or infancy was recorded as female, or who reported their sex as female at the time of collection.

#### CODE 3 Another term

Persons whose sex at birth or infancy was recorded as another term (not male or female), or who reported their sex as another term (not male or female) at the time of collection.

The value meaning of 'Another term' has been assigned to Code 3 for this value domain, which replaces 'Other' and 'Intersex or indeterminate'. The third option recognises that across Australian jurisdictions and elsewhere there are a range of terms used.

#### CODE 9 Not stated/inadequately described

This supplementary value is used to code inadequately described responses and non-responses for sex. It is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

### *Collection methods*

This may be used to collect either sex recorded at birth or sex reported at the time of collection. This information should be specified in the Data Set Specific Information in order to provide transparency about which type of data was collected.

The Australian Bureau of Statistics (ABS) Standard for sex, gender, variations of sex characteristics and sexual orientation variables (ABS 2021) recommends that where data on sex is collected, the preferred question should relate to sex recorded at birth. Sex recorded at birth refers to what was determined by sex characteristics observed at birth or infancy. This is an important indicator for statistical analysis in births and deaths, health statistics, calculating fertility rates and deriving counts for cis and trans populations.

A data collection may instead collect data on a person's sex at the time of collection, rather than their sex recorded at birth. However, there are advantages of sex recorded at birth as the sex question and further data that can be derived when using sex recorded at birth as the sex question.

Caution should be exercised when comparing counts for sex of a person recorded at birth and the sex of a person reported at the time of data collection, as a person's reported sex may change over the course of their lifetime. Also, as the terms sex and gender are often used interchangeably, a respondent might provide a gender response to a sex question.

#### Standard questions

##### **Sex recorded at birth**

The ABS recommends the following standard question structure:

What was [your/Person's name/their] sex recorded at birth? Please [tick/mark/select] one box.

Male

Female

Another term (please specify)

The following elements must be included:

- The words 'sex recorded at birth' in the question to clearly articulate the concept being collected
- Label the response options 'Male', 'Female', and 'Another term (please specify)'
- A write-in facility is available when the 'Another term (please specify)' response option is selected
- Only one response is permitted
- If this question is interviewer administered, the question must always be asked as written and no assumptions made by the interviewer.

The following elements are recommended for inclusion:

- Use inclusive language (for example 'they' or 'their' rather than 'he/she' or 'his/her')
- If both sex and gender questions are included, ask the sex question first and note that a separate question on gender is also asked
- If both sex and gender questions are included, ask both on the same page if practical.

### **Sex reported at time of data collection**

The ABS recommends the following standard question structure:  
What is [your/Person's name/their] sex? Please [tick/mark/select] one box.

Male

Female

Another term (please specify)

The following elements must be included:

- The word 'sex' in the question to clearly articulate the concept being collected
- Label the response options 'Male', 'Female', and 'Another term (please specify)'
- A write-in facility is available when the 'Another term (please specify)' response option is selected
- Only one response is permitted
- If this question is interviewer administered, the question must always be asked as written and no assumptions made by the interviewer.

The following elements are recommended for inclusion:

- Use inclusive language (for example 'they' or 'their' rather than 'he/she' or 'his/her')

- If both sex and gender questions are included, ask the sex question first and note that a separate question on gender is also asked in the survey
- If both sex and gender questions are included, ask both on the same page of the instrument if practical.

The Australian Government Guidelines on the Recognition of Sex and Gender recommend 'departments and agencies should refrain from making assumptions about a person's sex and/or gender identity based on indicators such as their name, voice or appearance' (AG 2015.)

The inclusion of the write-in facility for 'Another term' as a third response option recognises that there are a range of terms used to describe sex which is neither male nor female, and enhances data quality.

*Comments*

A person's sex is based upon their sex characteristics, such as their chromosomes, hormones and reproductive organs. While typically based upon the sex characteristics observed and recorded at birth or in infancy, a person's reported sex can change over the course of their lifetime and may differ from their sex recorded at birth.

Where this data element is used to record sex reported at the time of collection, the data may not be used to derive cis and trans counts through the 'two-step method'.

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Gender is a social and cultural concept. It is about social and cultural differences in identity, expression and experience as a man, boy, woman, girl, or non-binary person. Non-binary is an umbrella term describing gender identities that are not exclusively male or female.</p> <p>Gender includes the following concepts:</p> <ul style="list-style-type: none"><li>• Gender identity is about who a person feels themselves to be</li><li>• Gender expression is the way a person expresses their gender. A person's gender expression may also vary depending on the context, for instance expressing different genders at work and home</li><li>• Gender experience describes a person's alignment with the sex recorded for them at birth, that is, a cis experience or a trans experience' (ABS 2021).</li></ul> <p>The terms sex and gender are interrelated and often used interchangeably; however, they are two distinct concepts:</p> <ul style="list-style-type: none"><li>• Sex is understood in relation to sex characteristics. Sex recorded at birth refers to what was determined by sex characteristics observed at birth or infancy</li><li>• Gender is about social and cultural differences in identity, expression, and experience.</li></ul> <p>While they are two related concepts, caution should be exercised when comparing counts for sex with those for gender.</p>
----------------------	--

"The preferred Australian Government approach is to collect and use gender information. Information regarding sex would ordinarily not be required and should only be collected where there is a legitimate need for that information and it is consistent with Australian Privacy Principle 3." (AGD 2015) is the permissible values are based on the Australian Bureau of Statistics Standard for sex, gender, variations of sex characteristics and sexual orientation variables (ABS 2021). The values are defined as follows:

CODE 1 Man, or boy, or male

A person who describes their gender as man, or boy, or male.

CODE 2 Woman, or girl, or female

A person who describes their gender as woman, or girl, or female.

CODE 3 Non-binary

A person who describes their gender as non-binary.

CODE 4 Different term

A person who describes their gender as a term other than man/boy/male, woman/girl/female, or non-binary.

CODE 5 Prefer not to answer

A person who prefers not to respond on how they describe their gender.

CODE 9 Not stated or inadequately described.

This supplementary value is used to code inadequately described responses and non-responses for gender. It is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

### *Collection methods*

#### Standard Question Module

The following standard question module is based on that recommended in the Australian Bureau of Statistics Standard for sex, gender, variations of sex characteristics and sexual orientation variables (ABS 2021): How [do/does] [you/Person's name/they] describe [your/their] gender?

Gender refers to current gender, which may be different to sex recorded at birth and may be different to what is indicated on legal documents.

Please [tick/mark/select] one box:

Man, or boy, or male

Woman, or girl, or female

Non-binary

[I/They] use a different term (please specify)

Prefer not to answer

### Mandatory elements

The following elements must be included:

- The word 'gender' in the question to clearly articulate the concept being collected
- Label the response options 'Man, or boy, or male', 'Woman, or girl, or female', 'Non-binary', '[I/they] use a different term (please specify)', and 'Prefer not to answer'
- A write-in facility is available when the '[I/they] use a different term (please specify)' response option is selected
- Including a note to respondents that 'Gender refers to current gender, which may be different to sex recorded at birth and may be different to what is indicated on legal documents'
- Only one response is permitted
- If this question is interviewer administered, the question must always be asked as written and no assumptions made by the interviewer.

### Recommended elements

The following elements are recommended for inclusion:

- Use inclusive language (for example 'they' or 'their' rather than 'he/she' or 'his/her')
- If both sex and gender questions are included, ask the sex question first and note that a separate question on gender is also asked
- If both sex and gender questions are included, ask both on the same page if practical.

The Australian Government Guidelines on the Recognition of Sex and Gender recommend 'departments and agencies should refrain from making assumptions about a person's sex and/or gender identity based on indicators such as their name, voice or appearance' (AG 2015).

The inclusion of the write-in facility for 'Different term' as a response option recognises that there are a range of terms used to describe gender which is neither male nor female, and enhances data quality. Where the "Different term" code has been selected for gender, the data element Person—gender, text X[X(99)] may be used to capture any further (optional) specification of gender descriptors.

Note: Where written responses for CODE 4 (T) 'Different term' indicate a variation of one of 'Man, or boy, or male', 'Woman, or girl, or female' or 'Non-binary', those responses may be coded to the associated label.

### *Comments*

A person's gender may stay the same or can change over the course of their lifetime. The gender response option chosen will reflect a person's gender at that point in time. Some people may not identify with a specific gender or with the concept of gender at all.

#### Collection and usage attributes

<i>Guide for use</i>	<p>The classification for Indigenous status has a hierarchical structure comprising two levels. There are four categories at the detailed level of the classification which are grouped into two categories at the broad level. There is one supplementary category for 'Not stated/inadequately described' responses. The classification is as follows:</p> <p><b>Indigenous Australians:</b></p> <ul style="list-style-type: none"><li>• Aboriginal but not Torres Strait Islander origin.</li><li>• Torres Strait Islander but not Aboriginal origin.</li><li>• Both Aboriginal and Torres Strait Islander origin.</li></ul> <p><b>Non-Indigenous Australians:</b></p> <ul style="list-style-type: none"><li>• Neither Aboriginal nor Torres Strait Islander origin.</li></ul> <p><b>Not stated/inadequately described:</b></p> <p>This category is not to be available as a valid answer to the questions but is intended for use:</p> <ul style="list-style-type: none"><li>• Primarily when importing data from other data collections that do not contain mappable data.</li><li>• Where the answer cannot be determined without clarification from the respondent (for example, 'No' and 'Yes, Aboriginal' are both selected).</li><li>• Where an answer was declined.</li></ul>
----------------------	--

- Where the question was not able to be asked because the individual was unable to communicate or a person who knows the individual was not available.

The Indigenous status question allows for more than one response. The procedure for coding multiple responses is as follows:

- If the respondent answers 'Yes, Aboriginal' and 'Yes, Torres Strait Islander', then their response should be coded to 'Yes, both Aboriginal and Torres Strait Islander origin'.
- If the respondent answers 'No' and one or more of the following:
  - 'Yes, Aboriginal'
  - 'Yes, Torres Strait Islander'
  - 'Yes, both Aboriginal and Torres Strait Islander'

then the response should be coded to 'Not stated/inadequately described' if the response cannot be clarified with the respondent.

The following information provides advice on the recommended way to ask the Indigenous status question.

#### **Self-enumerated collections**

For self-enumerated collections (for example, self-completed questionnaires or forms), the following question is recommended:

*Q1. [Are you] [Is the person] [Is (name)] of Aboriginal or Torres Strait Islander origin?*

- No
- Yes, Aboriginal
- Yes, Torres Strait Islander

*If [you] [the person] [(name)] are of both Aboriginal and Torres Strait Islander origin, answer using both 'Yes' options.*

This approach may be problematic in some data collections, for example when data are collected using screen based data capture systems. An additional response category of 'Yes, both Aboriginal and Torres Strait Islander' may be included if this better suits the data collection practices of the agency or establishment concerned.

If the Indigenous status question has not been completed on a returned form, this should be followed up and confirmed with the person.

#### **Interviewer-conducted collections**

For interviewer-conducted collections in which the Indigenous status of one person is collected, the following question set is recommended:

*Q1. Are you of Aboriginal or Torres Strait Islander origin?*

- Yes
- No (no more questions)

*Q2. Are you of Aboriginal origin, Torres Strait Islander origin, or both?*

- Aboriginal
- Torres Strait Islander
- Both Aboriginal and Torres Strait Islander

### *Collection methods*

The first question is used to sequence out non-Indigenous Australians. The second question is used to determine the specific Aboriginal and/or Torres Strait Islander origin of the person. A benefit of this approach is that the interviewer is not required to prompt the respondent with response categories. The 'Both Aboriginal and Torres Strait Islander' response category can be included or excluded in interviewer conducted collections depending on which option best suits the data collection practices of the agency concerned. Including the additional response category ensures that respondents are aware of the option to identify as being of both Aboriginal and Torres Strait Islander origin.

Various articulations of the standard question are recommended to address the following circumstances:

Person is present and answers

This question wording is recommended where it is known that the person being interviewed is the subject:

*Q1. Are you of Aboriginal or Torres Strait Islander origin?*

*Q2. Are you of Aboriginal origin, Torres Strait Islander origin, or both?*

Person is not present and someone else who knows the person well answers

The following question wording is recommended when another member of the household answers for the person. Examples of such incidents include: parents answering for children, or relatives answering in hospital situations.

*Q1. Is [the person] [(name)] of Aboriginal or Torres Strait Islander origin?*

*Q2. Is [the person] [(name)] of Aboriginal origin, Torres Strait Islander origin, or both?*

Person is deceased and someone else answers on their behalf (for example, death information form)

In these circumstances a close relative or friend should answer. Only if a relative or friend is unavailable should the undertaker or other such person answer. The suggested question wording follows:

*Q1. Was [the person] [(name)] of Aboriginal or Torres Strait Islander origin?*

*Q2. Was [the person] [(name)] of Aboriginal origin, Torres Strait Islander origin, or both?*

Person is an infant and parents answer (for example perinatal information form)

In this circumstance it is recommended that parents are asked:

*Q1. Is [the baby's] [(name)'s] mother of Aboriginal or Torres Strait Islander origin?*

*Q2. Is [the baby's] [(name)'s] mother of Aboriginal origin, Torres Strait Islander origin, or both?*

and

*Q1. Is [the baby's] [(name)'s] father of Aboriginal or Torres Strait Islander origin?*

*Q2. Is [the baby's] [(name)'s] father of Aboriginal origin, Torres Strait Islander origin, or both?*

For interview conducted collections in which the Indigenous Status of more than one person is collected from a household representative, the following question set is recommended:

*Q1. Is anyone who (usually lives here) (or) (is visiting here) of Aboriginal or Torres Strait Islander origin?*

- Yes
- No

*Q2. Who are they?*

*Question 3 is asked of each person identified as being of Aboriginal or Torres Strait Islander origin.*

*Q3. [Are you] [Is (name)] of Aboriginal origin, Torres Strait Islander origin, or both?*

- Aboriginal
- Torres Strait Islander
- Both Aboriginal and Torres Strait Islander

The first question is used to sequence out households in which no Aboriginal and/or Torres Strait Islander people usually live (or are visiting). The second question is used to identify those usual residents (and visitors) of Aboriginal or Torres Strait Islander origin. This approach eliminates the need to repeatedly ask the Indigenous status question of each individual in a household when data are collected on a single household form. It is particularly advantageous when collecting from areas with a large proportion of households with non-Indigenous Australians.

#### **For both self-enumerated collections and interviewer-conducted collections**

The Indigenous status question can be used in circumstances where a close relative, friend, or another member of the household is answering on behalf of the subject. It is strongly recommended that the question be asked directly wherever possible.

When the subject person is not present, the person answering for them should be in a position to do so, that is, this person must know the person about whom the question is being asked well and feel confident to provide accurate information about them.

The Indigenous status question must always be asked regardless of data collectors' perceptions based on appearance or other factors.

The Indigenous status question may only be left unanswered in the following circumstances:

- Where the person declined to answer
- Where the question was not able to be asked because the individual was unable to communicate or a person who knows the individual was not available.

### Comments

The following definition, commonly known as 'The Commonwealth Definition', was given in a High Court judgement in the case of *Commonwealth v Tasmania* (1983) 46 ALR 625.

'An Aboriginal or Torres Strait Islander is a person of Aboriginal or Torres Strait Islander descent who identifies as an Aboriginal or Torres Strait Islander and is accepted as such by the community in which he or she lives'.

There are three components to the Commonwealth definition:

- descent;
- self-identification; and
- community acceptance.

In practice, it is not feasible to collect information on the community acceptance part of this definition in general purpose statistical and administrative collections and therefore standard questions on Indigenous status relate to descent and self-identification only.

#### Collection and usage attributes

<i>Guide for use</i>	<p>The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure. The most detailed level of the classification consists of languages which are represented by four-digit codes. The second level of the classification comprises narrow groups of languages (the Narrow group level), identified by two-digit and three-digit codes. The most general level of the classification consists of broad groups of languages (the Broad group level) and is identified by one-digit codes. The classification includes Australian Indigenous languages and sign languages. For example, the Lithuanian language has a code of 3102. In this case 3 denotes that it is an Eastern European language, while 31 denotes that it is a Baltic language. The Pintupi Aboriginal language is coded as 8713. In this case 8 denotes that it is an Australian Indigenous language and 87 denotes that the language is a Western Desert language.</p> <p>Language data may be output at the Broad group level, Narrow group level or the language level of the classification. Also, significant languages within a Narrow group can be presented separately with the remaining languages of the Narrow group aggregated. The same principle can be adopted to highlight significant Narrow groups within a Broad group</p>
<i>Collection methods</i>	<p>Where extensive data on main language other than English spoken at home is needed, one of the two questions below may be used:</p> <p>Alternative 1</p> <p><i>Do you/Does the person/Does (name)/ Will (name of child under two years) speak a language other than English at home? (If more than one language, indicate the language that is spoken most often.)</i></p>

No, (English only)

Yes, Mandarin

Yes, Italian

Yes, Arabic

Yes, Cantonese

Yes, Greek

Yes, Vietnamese

Yes, Spanish

Yes, Hindi

Yes, Tagalog

Yes, Other (please specify) \_\_\_\_\_

The above list includes languages based on their statistical frequency in Australia, based on data from the Census of Population and Housing.

Alternative 2

Do you/Does the person/Does (name)/ Will (name of child under two years) speak a language other than English at home?

No, English only

Yes, Other - please specify \_\_\_\_\_

Where there is no requirement for detailed language data, the following question may be suitable:

Do you/Does the person/Does (name)/ Will (name of child under two years) speak a language other than English at home?

No, English only

Yes, Other

### Comments

This data element is important in identifying those people most likely to suffer disadvantage in terms of their ability to access services due to language and/or cultural difficulties. In conjunction with Indigenous status, Proficiency in spoken English and Country of birth this data element forms the minimum core set of cultural and language indicators recommended by the ABS.

Data on main language other than English spoken at home are regarded as an indicator of 'active' ethnicity and also as useful for the study of inter-generational language retention. The availability of such data may help providers of health and community services to effectively target the geographic areas or population groups that need those services. It may be used for the investigation and development of language services such as interpreter/ translation services.

#### Collection and usage attributes

*Guide for use* The Standard Australian Classification of Countries 2016 is a four-digit, three-level hierarchical structure specifying major group, minor group, and country. A country, even if it comprises other discrete political entities such as states, is treated as a single unit for all data domain purposes. Parts of a political entity are not included in different groups. Thus, Hawaii is included in Northern America (as part of the identified country United States of America), despite being geographically close to and having similar social and cultural characteristics as the units classified to Polynesia.

*Collection methods* Some data collections ask respondents to specify their country of birth. In others, a pre-determined set of countries is specified as part of the question, usually accompanied by an 'other (please specify)' category.

Recommended questions are:

*In which country were you/was the person/was (name) born?*

*Australia*

*Other (please specify) ...*

or

*In which country were you/was the person/was (name) born?*

*Australia*

*England*

*New Zealand*

*India*

*Italy*

*Vietnam*

*Philippines*

*South Africa*

*Scotland*

*Malaysia*

*Other (please specify) ...*

The option list for this question includes countries according to their statistical frequency in Australia, according to data from the Census of Population and Housing. Exceptions are made for countries such as 'United Kingdom' and 'China', as they are likely to reduce the level of detail that is possible to be coded to the Standard Australian Classification of Countries.

Value	Meaning								
1	CALD								
2	Not CALD								
9	Not stated/inadequately described								

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>CALD is an Australian term that is used for people that are culturally and linguistically diverse. There are differences in how CALD is defined, but a common definition where country of birth and a language variable are collected is to include people born in countries other than those identified by the ABS as the main English-speaking countries (MESC) from which Australia receives a significant number of migrants and/or those who report that they speak a language other than English at home (AIHW 2022).</p> <p>This aligns with the definition suggested following a review of CALD definitions as people born in non-English speaking countries, and/or who do not speak English at home, with Aboriginal and Torres Strait Islander people considered separately (Pham 2021).</p> <p>For this definition, CALD status is derived from the two data items B9 'Country of birth' and B8 'Main language other than English spoken at home'.</p> <p>CALD is defined as:</p> <ul style="list-style-type: none"><li>• people born overseas in countries where English is not the main language spoken (people whose country of birth is not Australia and its external territories, New Zealand, the United Kingdom, Ireland, the United States of America, Canada, or South Africa—this selection of countries is based on the main countries from which Australia receives settlers who are likely to speak English).</li></ul> <p>and/or</p> <ul style="list-style-type: none"><li>• people born in Australia whose main language other than English spoken at home is not English (excluding Aboriginal languages).</li></ul>
----------------------	--

*Collection methods*

CALD status is derived from the two data items B9 'Country of birth' and B8 'Main language other than English spoken at home'.

## C9 Hysterectomy flag

---

### Identifying and definitional attributes

<i>Data item name</i>	Hysterectomy flag
<i>Definition</i>	An indication as to whether a participant has had a total hysterectomy (removal of uterus and cervix).
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code
<i>Data type</i>	Number
<i>Format</i>	{N}
<i>Maximum character length</i>	1
<i>Permissible values</i>	<b>Value</b> <b>Meaning</b>
	1              Total hysterectomy

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	Hysterectomy flag should be raised at such time as it is known that a participant has had a total hysterectomy.
<i>Rules for use</i>	If C10 'Date of hysterectomy' is not NULL, C9 'Hysterectomy flag' should be = 1.
<i>Collection methods</i>	While this can be communicated by the practitioner or participant procedure code for total hysterectomy should also trigger the hysterectomy flag.
<i>Comments</i>	Whether or not a participant who had had a total hysterectomy will require further follow-up within the National Cervical Screening Program should be according to clinical recommendations in the <i>National Cervical Screening Program: Guidelines for the management of screen-detected abnormalities, screening in specific populations and investigation of abnormal vaginal bleeding</i> (as per 'Flowchart 13.1 Vaginal screening after total hysterectomy') (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party).

## C11 Death flag

---

### Identifying and definitional attributes

<i>Data item name</i>	Death flag
<i>Definition</i>	An indication as to whether a participant is deceased.
<i>Context</i>	These data are essential to ensure that correspondence is not sent to deceased people to avoid potential distress for the participant's family or friends.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code				
<i>Data type</i>	Number				
<i>Format</i>	{N}				
<i>Maximum character length</i>	1				
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Deceased</td></tr></tbody></table>	Value	Meaning	1	Deceased
Value	Meaning				
1	Deceased				

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	
<i>Rules for use</i>	If C12 'Date of death' is not NULL, C11 'Death flag' should be = 1.
<i>Collection methods</i>	Frequent linking to the National Death Index or similar source of identified deaths data.

#### Relational attributes

<i>Related metadata references</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> C11 Death flag
------------------------------------	--

---

---

## C12 Date of death

---

### Identifying and definitional attributes

<i>Data item name</i>	Date of death
<i>Definition</i>	The date of death of a participant.
<i>Context</i>	Required to prevent screening reminder letters or other correspondence being sent to deceased people.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Date
<i>Data type</i>	Date/Time
<i>Format</i>	{DDMMYYYY}
<i>Maximum character length</i>	8

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	While it is preferable that this be an accurate date of death, part of the date may need to be estimated. If this date needs to be estimated, the following guide should be used; if only the year and month is known, date should be set to 01MMYYYY; if only the year is known, date should be set to 0107YYYY.
<i>Rules for use</i>	If C11 'Death flag' = 1, C12 'Date of death' should not be NULL.
<i>Collection methods</i>	This data item should always be recorded as an 8-digit valid date comprising day, month, and year. Year should always be recorded in its full 4-digit format. For days and months with a numeric value of less than 10, zeros should be used to ensure that the date contains the required 8 digits. For example, a date of 1 July 2015 should be recorded as 01072015 as specified in the representational layout.
<i>Comments</i>	Depending on how this information is collected, day or even month may not be known. The death flag should be used as soon as it is known that a participant has died, as it is important individuals who are deceased are not sent correspondence (this is more important than recording the day and month of death).

## C13 DES exposed

---

### Identifying and definitional attributes

<i>Data item name</i>	DES exposed
<i>Definition</i>	An indication of whether a participant was exposed to diethylstilboestrol (DES) in utero
<i>Context</i>	People exposed to DES in utero are at increased risk of clear cell carcinoma of the vagina and cervix.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code				
<i>Data type</i>	Number				
<i>Format</i>	{N}				
<i>Maximum character length</i>	1				
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>DES exposed</td></tr></tbody></table>	Value	Meaning	1	DES exposed
Value	Meaning				
1	DES exposed				

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>DES exposed should be coded to '1' at such time as it is known that a participant was exposed to DES in utero.</p> <p>The Guidelines for the management of screen-detected abnormalities, screening in specific populations and investigation of abnormal vaginal bleeding (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party) include recommendations specific for cervical screening in DES-exposed people. These recommendations are that people exposed to DES in utero should be offered an annual co-test and colposcopic examination of both the cervix and vagina indefinitely, and that people exposed to DES in utero who have a screen-detected abnormality should be managed by an experienced colposcopist.</p> <p>There is very little evidence on the risk of cervical cancer in daughters of those exposed to DES in utero. Therefore the Guidelines note that they should be screened with 5-yearly HPV testing unless they have concerns, in which case annual co-testing (similar to their DES-exposed mothers) could be offered by clinicians on an individual basis to provide reassurance.</p>
<i>Collection methods</i>	A medical practitioner is likely to note that a person was exposed to DES in utero given the higher risk of cervical and vaginal cancer and the need for a different cervical screening process.
<i>Comments</i>	DES is a synthetic oestrogen that was prescribed predominantly in the first trimester of pregnancy from the 1940s until the early 1970s. There is substantial evidence indicating that those exposed in utero to DES have a markedly increased risk of clear cell carcinoma of the vagina and cervix (IARC 2012).

## C14 Immunocompromised

---

### Identifying and definitional attributes

<i>Data item name</i>	Immunocompromised
<i>Definition</i>	An indication of whether a participant is immunocompromised
<i>Context</i>	People with HIV and solid organ transplant recipients have been defined as sufficiently immune-deficient to warrant more frequent screening and a lower threshold for colposcopy referral than the general population.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code						
<i>Data type</i>	Number						
<i>Format</i>	{N}						
<i>Maximum character length</i>	1						
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Immunocompromised due to HIV or solid organ transplant</td></tr><tr><td>2</td><td>Immunocompromised due to other reason</td></tr></tbody></table>	Value	Meaning	1	Immunocompromised due to HIV or solid organ transplant	2	Immunocompromised due to other reason
Value	Meaning						
1	Immunocompromised due to HIV or solid organ transplant						
2	Immunocompromised due to other reason						

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Immunocompromised should be coded to '1' at such time as it is known that a participant is immunocompromised due to HIV or solid organ transplant.</p> <p>Immunocompromised should be coded to '2' at such time as it is known that a participant is immunocompromised due to other reasons (such as congenital immune deficiency, being treated with immunosuppressant therapy for autoimmune disease, or being treated for graft versus host disease).</p> <p>The Guidelines for the management of screen-detected abnormalities, screening in specific populations and investigation of abnormal vaginal bleeding (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party) include recommendations specific for cervical screening in people with HIV and solid organ transplant recipients. These recommendations are that people that are immunocompromised due to HIV or solid organ transplant who have an HPV test in which oncogenic HPV types are not detected should be screened every 3 years with an HPV test, and those who have a positive oncogenic HPV (any type) test result should be referred for colposcopic assessment informed by the reflex LBC.</p>
----------------------	--

People with congenital immune deficiency, being treated with immunosuppressant therapy for autoimmune disease, or being treated for graft versus host disease could also be considered for 3-yearly cervical screening.

*Collection methods*

A medical practitioner is likely to note that a person is immunocompromised and for what reason.

*Comments*

Refer to the many 'Practice point' entries for immunocompromised people in the Guidelines (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party) for further information.

4	Vaccinated – no valid status												

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Vaccination status is according to clinical completion status, which is derived from HPV vaccination data held by the Australian Immunisation Register based on an algorithm that considers number of doses and length of time between doses.</p> <p>‘Unvaccinated’ refers to individuals who have never received a dose of HPV vaccine.</p> <p>‘Complete’ refers to people who received a full course of HPV vaccine at adequate intervals.</p> <p>‘Incomplete’ refers to people who received less than a full course of HPV vaccine.</p> <p>‘Too close’ refers to people who received their HPV vaccine doses too close together, and as such their clinical status is uncertain. Definitions of ‘complete’, ‘incomplete’ and ‘too close’ are subject to change based on future research findings.</p> <p>‘No valid status’ is to be used for people who have data items recorded for HPV vaccination but do not have a valid clinical completion status. These people should not be interpreted as ‘unvaccinated’, which is to be reserved for people who have never received a dose of HPV vaccine.</p>
<i>Comments</i>	<p>HPV vaccination has undergone two major changes since it was introduced in Australia in April 2007. HPV vaccination was originally a 3-dose schedule using Gardasil® (or Cervarix), which provides protection against HPV types 6, 11, 16, and 18. From January 2018, the three-dose schedule was replaced with a 2-dose schedule using</p>

Gardasil®9, which provides protection against HPV types 6, 11, 16, 18, 31, 33, 45, 52, and 58. Then from 6 February 2023, the two-dose schedule was replaced with a single-dose schedule using Gardasil®9. While some of the permissible values for this data item do not apply to the more recent HPV vaccination schedule/s, they have been retained to allow the analysis and reporting of historical data. The National HPV Vaccination Program Register ceased on 31 December 2018; all HPV vaccinations are now recorded on the Australian Immunisation Register.

## D5 HPV vaccine implied dose number

---

### Identifying and definitional attributes

<i>Data item name</i>	HPV vaccine implied dose number
<i>Definition</i>	The clinically valid dose number of HPV vaccine.
<i>Collection status</i>	Conditional (essential for vaccinated people)

### Value domain attributes

---

<i>Representation class</i>	Code
<i>Data type</i>	Number
<i>Format</i>	[NN]
<i>Maximum character length</i>	2

### Data item attributes

---

#### Collection and usage attributes

*Guide for use* Implied dose number is the clinically valid dose number, and takes into account the length of time between doses. It uses the same algorithm used for D1 'HPV vaccination clinical completion status' to determine the number of clinically valid doses administered. Implied dose number of 1 will be the same as the actual dose number, but may differ from actual dose number for subsequent doses. Implied dose number will also remain the same for any doses that are received after they are clinically completely vaccinated.

For example:

Actual dose number	Implied dose number
1	1
2	1
3	2
4	3
5	3

This data item will not be populated for unvaccinated people.

*Comments* HPV vaccination has undergone two major changes since it was introduced in Australia in April 2007. HPV vaccination was originally a 3-dose schedule using Gardasil® (or Cervarix), which provides protection against HPV types 6, 11, 16, and 18. From January 2018, the three-dose schedule was replaced with a 2-dose schedule using Gardasil®9, which provides protection against HPV types 6, 11, 16, 18, 31, 33, 45, 52, and 58. ## Group E: Participant demographic data items

Demographic analysis is performed on the address attributed to a related cervical test.

Participants may have differing addresses across multiple tests, all of which need to be captured, with the ability to identify a specific address for a given cervical test.

While it is preferable that demographic analyses are performed on place of residence, this may not be known, in which case an alternative address may be used. However, address data items are all specified as *residential* to reflect that this is the appropriate address for demographic analyses.

- E1 Residential address
- E2 Residential suburb/town/locality
- E3 Residential alternative or other names for suburb/town/locality
- E4 Residential Australian state/territory
- E5 Residential Australian postcode
- E6 Residential geocode – latitude
- E7 Residential geocode – longitude
- E8 Residential geocode – quality
- E9 Residential SA1

---

## E1 Residential address

---

### Identifying and definitional attributes

<i>Data item name</i>	Residential address
<i>Definition</i>	The address where an invitee or participant usually resides.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Text
<i>Data type</i>	String
<i>Format</i>	X[X(179)]
<i>Maximum character length</i>	180

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Address is a composite of one or more standard address components that describes a low level of geographical/physical description of a location. Used in conjunction with the other high-level address components, that is, Suburb/town/locality, Postcode – Australian, Australian state/territory, and Country, forms a complete geographical/physical address of an invitee or participant.</p> <p>Residential or a postal (mailing) address should be provided for an invitee or participant.</p>
----------------------	--

<i>Related metadata references</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> E1 Residential address
------------------------------------	--

---

---

## E2 Residential suburb/town/locality

---

### Identifying and definitional attributes

<i>Data item name</i>	Residential suburb/town/locality
<i>Definition</i>	The suburb/town/locality where an invitee or participant usually resides.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Text
<i>Data type</i>	String
<i>Format</i>	A[A(49)]
<i>Maximum character length</i>	50

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Suburb/town/locality is the text that represents the full name of the locality contained within the specific address of an invitee or participant.</p> <p>The suburb/town/locality name may be a town, city, suburb, or commonly used location name such as a large agricultural property or Aboriginal community. The Australian Bureau of Statistics has suggested that a maximum field length of 50 characters should be sufficient to record the vast majority of locality names. This metadata item may be used to describe the location of person, organisation, or event. It can be a component of a street or postal address.</p> <p>If there is no data for this item, please refer to E3 'Residential alternative or other names for suburb/town/locality' as this may contain an alternative name by which the locality can be known.</p> <p>Residential or a postal (mailing) address should be provided for an invitee or participant.</p>

## E5 Residential Australian postcode

---

### Identifying and definitional attributes

<i>Data item name</i>	Residential Australian postcode
<i>Definition</i>	The code that represents a postal delivery area, aligned with locality, suburb, or place for the address where an invitee or participant usually resides.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Code
<i>Data type</i>	String
<i>Format</i>	NNNN
<i>Maximum character length</i>	4

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	This data item is important for national reporting by the Australian Institute of Health and Welfare.
<i>Comments</i>	Must accept zero as the leading digit to accommodate all Australian postcodes. Australian Postcode may be used in the analysis of data on a geographical basis, which involves a conversion from postcodes to the Australian Bureau of Statistics (ABS) postal areas. This conversion results in some inaccuracy of information. However, in some data sets postcode is the only geographic identifier, therefore the use of other more accurate indicators is not always possible.

#### Collection and usage attributes

<i>Guide for use</i>	SA1 coding structure:  SA1s are identified by an 11-digit fully hierarchical code. The SA1 identifier is a 2-digit code, assigned within an SA2. An SA1 code is only unique within a state/territory when it is preceded by the state/territory identifier.
----------------------	---

For example:

State/territory	SA4	SA3	SA2	SA1
N	NN	NN	NNNN	NN

<i>Comments</i>	There are approximately 55,000 SA1s. In aggregate, they cover the whole of Australia without gaps or overlaps. SA1 can be used in geospatial analyses to assign individuals to any geography that is larger than this, such as SA2, SA3, SA4, or to geographies of interest such as Primary Health Network (PHN).

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>There are many types of correspondence between the National Cancer Screening Register and a person. This data item is limited to correspondence related to invitations and reminders to screen and rescreen, and not the many other types of correspondence. This data item is further limited to correspondence sent to invitees and participants (excludes correspondence sent to providers). Invitations and reminders to screen and rescreen are based on the 'business as usual' protocol of action for the National Cervical Screening Program. 'Screen' refers to a participant's first screen in the program; 'rescreen' refers to any screen that is not their first.</p> <p>A1 &amp; A2 applies to:</p> <ul style="list-style-type: none"><li>• Invitees turning 25 who have never screened before (or were screened prior to 24 years and 9 months);</li><li>• Invitees aged <math>\geq 25</math> to <math>&lt;30</math> who have been newly identified from Medicare enrolment data and who have not been sent an invitation previously; and</li><li>• Invitees aged <math>\geq 25</math> to <math>&lt;30</math> who have never previously had a Pap test.</li></ul>
----------------------	---

B1 & B2 applies to:

- Invitees aged  $\geq 30$  to  $< 75$  who have been newly identified from Medicare enrolment data who have never screened and who have not been sent an invitation previously.

C1 & C2 applies to:

- Invitees aged  $\geq 30$  to  $< 75$  who have a screening history and are less than 2 years overdue for their next screening test.

D1 & D2 applies to:

- Invitees aged  $\geq 30$  to  $< 75$  who have a screening history and are 2 years or more overdue for their next screening test.

*Comments*

Although the eligibility criteria for self-collection were removed from 1 July 2022, invitations and reminders for 'self-collection eligible' invitees have been retained to support analysis of historical data.

Value	Meaning				
1	Correspondence failure				

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>'Correspondence failure' flag is to be used where an invitee or participant's contact details are found to be invalid for the purpose of the National Cancer Screening Register sending correspondence to an invitee or participant. This may take the form of a letter marked 'return to sender', or an email address that 'bounces'.</p> <p>This flag can be used several times for one invitee or participant, if more than one method of contact is determined to be invalid.</p> <p>In some instances an invitee or participant may only have one method of contact (usually a mailing address). If there are no other valid contact details recorded for an invitee or participant, they will be lost to follow-up/will be unable to be invited to screen or rescreen until such time as new contact information is received.</p>

#### Collection and usage attributes

<i>Guide for use</i>	This is an important date, as it is used to determine other features of interest that occur 'at time of test', such as age at test, remoteness area and socioeconomic area of residence at time of test, HPV vaccination status at time of test, etcetera.
<i>Collection methods</i>	<p>For a single cervical test, there can be a test request date, a test collection date, a laboratory receipt date, a laboratory report date, and a laboratory transmission date.</p> <p>The date of interest for reporting is the test collection date, as this is the date on which the specimen was collected.</p> <p>If test collection date is unknown, another date can be used instead, and will be treated as the test date.</p> <p>The order of priority for an alternative date is:</p> <ul style="list-style-type: none"><li>• test request date</li><li>• laboratory receipt date</li><li>• laboratory report date</li><li>• laboratory transmission date.</li></ul>
<i>Comments</i>	The National Cancer Screening Register needs to collect all dates associated with a test (test request date, test collection date, laboratory receipt date, laboratory report date and laboratory transmission date) to ensure timely progression of a specimen, for instance by determining the time between the laboratory receipt date, the laboratory report date, and the laboratory transmission date.

Value	Meaning														
C1	Primary screening HPV test														
C2	Follow-up HPV test (repeat HPV test after intermediate risk result)														
C3i	Co-test – test of cure														
C3ii	Co-test – investigation of signs or symptoms														
C3iii	Co-test – other, as recommended in guidelines														
C4	Other														

<i>Comments</i>	'C2' originally indicated it should be used for repeat HPV tests after an intermediate risk result and repeat HPV tests after an unsatisfactory test. However, since early 2018, pathology laboratories have used 'C2' for repeat HPV tests after an intermediate risk result ONLY. Repeat HPV tests after an unsatisfactory test are allocated the same 'Reason for HPV test' as the original test. This data item has been updated accordingly.

#### Collection and usage attributes

<i>Guide for use</i>	<p>'DU Unsatisfactory' indicates that the HPV test was unsatisfactory.</p> <p>'D0 Oncogenic HPV not detected' indicates that no oncogenic HPV types were detected.</p> <p>'D1 HPV 16/18 detected' indicates that one or more of the oncogenic HPV types 16 or 18 were detected. '1i Type 16 detected' indicates that the oncogenic HPV type 16 was detected.</p> <p>'D1ii Type 18 detected' indicates that the oncogenic HPV type 18 was detected.</p> <p>'D1iii Type 18/45 detected' indicates that oncogenic HPV types 18 or 45 were detected (specific to HPV tests that cannot distinguish between the detection of 18 and 45).</p> <p>'D2 Oncogenic HPV (not 16/18) detected' indicates that one or more of the oncogenic HPV types 31, 33, 35, 39, 45, 51, 52, 56, 58, 59, 66, or 68 were detected.</p>
----------------------	---

'D2i One or more of the following types detected: 31, 33, 45, 52, or 58' indicates that one or more of the oncogenic HPV types 31, 33, 45, 52, or 58 were detected.

'D2ii One or more of the following types detected: 35, 39, 51, 56, 59, 66, or 68' indicates that one or more of the oncogenic HPV types 35, 39, 51, 56, 59, 66, or 68 were detected.

*Collection methods*

The National Cancer Screening Register uses an algorithm to determine the most serious HPV type for each HPV test, which is recorded in this data item.

*Comments*

This data item combines three data items from the previous version of this data dictionary – H5 HPV test result – oncogenic HPV, H6 Secondary HPV test result – HPV 16/18 detected and H7 Secondary HPV test result – oncogenic HPV (not 16/18) detected.

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>While the most serious HPV type for each HPV test is recorded in H5 'HPV test result – oncogenic HPV', more rarely a secondary HPV type is detected by the pathology laboratory. This data item allows the collection of this secondary oncogenic HPV type.</p> <p>'DS1 HPV 16/18 detected' indicates that one or more of the oncogenic HPV types 16 or 18 were detected as the secondary HPV type.</p> <p>'DS1i Type 16 detected' indicates that the oncogenic HPV type 16 was detected as the secondary HPV type.</p> <p>'DS1ii Type 18 detected' indicates that the oncogenic HPV type 18 was detected as the secondary HPV type.</p> <p>'DS1iii Type 18/45 detected' indicates that one or more of the oncogenic HPV types 18 or 45 were detected (specific to HPV tests that cannot distinguish between the detection of 18 and 45).</p> <p>'DS2 Oncogenic HPV (not 16/18) detected' indicates that one or more of the oncogenic HPV types 31, 33, 35, 39, 45, 51, 52, 56, 58, 59, 66, or 68 were detected as the secondary HPV type.</p>
----------------------	---

'DS2i One or more of the following types detected: 31, 33, 45, 52, or 58' indicates that one or more of the oncogenic HPV types 31, 33, 45, 52, or 58 were detected as the secondary type.

'DS2ii One or more of the following types detected: 35, 39, 51, 56, 59, 66, or 68' indicates that one or more of the oncogenic HPV types 35, 39, 51, 56, 59, 66, or 68 were detected as the secondary HPV type.

*Comments*

In reality, neither 'DS1 HPV 16/18 detected' nor 'DS1i Type 16 detected' will ever be valid values for this data item as these will always be the most serious HPV type recorded at H5 'HPV test result – oncogenic HPV'. They have been included here to allow the permissible values for the data item to align with permissible values for H5 'HPV test result – oncogenic HPV'.

#### Collection and usage attributes

<i>Guide for use</i>	HPV test types have been grouped according to manufacture, with the specific platforms listed. This will provide detailed information about HPV test type for quality monitoring of this screening test, as well as enabling additional HPV test types to be added in the future.
<i>Comments</i>	The HPV test types listed here will be tests that are registered on the ARTG for HPV testing of cervical samples. It is not an indication of which tests are suitable for use in the National Cervical Screening Program. Only those HPV tests that meet the requirements set out in the NPAAC Standards and Performance Measures for cervical screening should be used in the National Cervical Screening Program. Tests that do not meet the

requirements now may meet them in future and therefore all tests listed on the ARTG will be coded. The HPV tests currently listed are tests which were known to be registered on the ARTG at the time of developing the data dictionary. There may be others that are on the ARTG and were not identified at the time of development or will be added in future. Any tests that are listed on the ARTG will be added to the data dictionary if the National Cervical Screening Program is informed.

### Data item attributes

---

#### Collection and usage attributes

Guide for use	<p>This data item is intended to provide information about the sample that is provided, and whether it is suitable for HPV testing and reflex LBC testing, or whether it is suitable only for HPV testing, with a second sample required for reflex LBC testing (if indicated).</p> <p>Values ≥90 will be suitable for HPV testing only, either due the sample being self-collected, or due to an inappropriate sampling device or sampling media being used.</p>
Collection methods	If the head of a swab is received by the laboratory in sampling media such as PreservCyt or SurePath, then it must be coded as '99 Flocked or cotton swab'.

---

## Identifying and definitional attributes

<i>Data item name</i>	Cytology test date
<i>Definition</i>	The date when a specimen for a cytology test was collected.
<i>Collection status</i>	Essential

## Value domain attributes

---

<i>Representation class</i>	Date
<i>Data type</i>	Date/Time
<i>Format</i>	DDMMYYYY
<i>Maximum character length</i>	8

## Data item attributes

---

### Collection and usage attributes

<i>Guide for use</i>	This is an important date, as it is used to determine other features of interest that occur 'at time of test', such as age at test, remoteness area and socioeconomic area of residence at time of test, HPV vaccination status at time of test, etcetera.
<i>Collection methods</i>	<p>For a single cervical test, there can be a test request date, a test collection date, a laboratory receipt date, a laboratory report date, and a laboratory transmission date.</p> <p>The date of interest for reporting is the test collection date, as this is the date on which the specimen was collected.</p> <p>If test collection date is unknown, another date can be used instead, and will be treated as the test date.</p> <p>The order of priority for an alternative date is:</p> <ul style="list-style-type: none"><li>• test request date</li><li>• laboratory receipt date</li><li>• laboratory report date</li><li>• laboratory transmission date.</li></ul>
<i>Comments</i>	<p>The National Cervical Screening Register needs to collect all dates associated with a specimen so that analyses can be performed to ensure timely progression of a specimen, for instance by determining the time between the laboratory receipt date, the laboratory report date, and the laboratory transmission date.</p> <p>Collected by pathology laboratories. If the cytology test is a reflex LBC, the cytology test date will be the same as the HPV test date.</p>

A3	Conventional smear and liquid-based specimen										

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	While the renewed National Cervical Screening Program uses reflex LBC as part of the screening test rather than a conventional Pap test, it is likely that some participants will have a conventional Pap test after the renewed National Cervical Screening Program commences, and it is important that the National Cancer Screening Register can record details of these tests.
<i>Comments</i>	Collected by pathology laboratories.

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>S1 Cell numbers and preservation satisfactory. No abnormality or only reactive changes</p> <p>Record this code where there is no abnormality detected and cell numbers and preservation are satisfactory.</p> <p>S2 Possible low-grade squamous intraepithelial lesion (LSIL)</p> <p>This code encompasses changes in squamous cells where the reporting cytologist/pathologist believes the changes may represent a low-grade squamous intraepithelial lesion, but no definitive changes are present.</p> <p>S3 Low-grade squamous intraepithelial lesion (LSIL) (HPV and/or CIN 1)</p>
----------------------	---

Record this code where the cytologist/pathologist observes changes which would have been described as HPV effect or CIN 1 (that is, incorporates HPV effect and/or CIN 1).

**S4 Possible high-grade squamous intraepithelial lesion (HSIL)**

Record this code when the presence of a high-grade squamous abnormality, such as CIN 2, CIN 3 or SCC is suspected, but the changes are insufficient to justify a confident cytological prediction of a high-grade lesion.

**S5 High-grade squamous intraepithelial lesion (HSIL)  
(CIN 2/CIN 3)**

Record this code where the changes observed would have previously been described as CIN 2 or CIN 3 (that is, code S5 incorporates CIN 2 and CIN 3.)

**S6 High-grade squamous intraepithelial lesion (HSIL) with possible microinvasion/invasion**

Record this code when a definite HSIL is present, but the possibility of invasion cannot be excluded.

**S7 Squamous carcinoma**

Record this when squamous carcinoma is present.

**SU Unsatisfactory for evaluation**

Record this code if the specimen is unable to be assessed due to poor cellularity, poor preservation, cell detail obscured by inflammation/blood/degenerate cells.

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>E0 No endocervical component</p> <p>Record this code when there is no endocervical component.</p> <p>E- Not applicable: vault smear/previous hysterectomy</p> <p>Record this code when it is a vault smear or there has been a previous total hysterectomy.</p> <p>E1 Endocervical component present. No abnormality or only reactive changes</p> <p>Record this code if no abnormality is detected and cell numbers and preservation is satisfactory.</p> <p>E2 Atypical endocervical cells of uncertain significance</p>
----------------------	---

Record this code when abnormal glandular cells are identified in a cervical cytology sample, but where the degree of abnormality is not sufficient for a diagnosis of adenocarcinoma-in-situ to be made.

E3 Possible high-grade endocervical glandular lesion

Record this code if adenocarcinoma-in-situ is suspected but a confident prediction is not possible.

E4 Endocervical adenocarcinoma-in-situ

Record this code when the reporting cytologist/pathologist is confident of the presence of an adenocarcinoma-in-situ.

E5 Endocervical adenocarcinoma-in-situ with possible microinvasion /invasion

Record this code when a definite adenocarcinoma-in-situ is present, but the possibility of invasion cannot be excluded.

E6 Endocervical adenocarcinoma

Record this code when a definite adenocarcinoma is present.

EU Due to the unsatisfactory nature of the cytology specimen, no assessment has been made.

Unable to be assessed due to poor cellularity, poor preservation, cell detail obscured by blood/inflammation/degenerate cells. If a cytology specimen is sub optimal but atypical/abnormal cells are detected, the abnormality overrides the unsatisfactory coding and should be coded to reflect the abnormality detected.

#### **Collection and usage attributes**

<i>Guide for use</i>	<p>O1 No other abnormal cells</p> <p>Record this code where there is no abnormality detected and cell numbers and preservation are satisfactory.</p> <p>O2 Atypical endometrial cells of uncertain significance</p> <p>Record this code where there are changes in endometrial cells, but insufficient to raise the possibility of an endometrial carcinoma.</p> <p>O3 Atypical glandular cells of uncertain significance – site unknown</p> <p>Record this code where there is uncertainty about whether the abnormal cells were endocervical or endometrial in origin. Use where changes are insufficient to raise the possibility of a neoplasm but are beyond a reactive process.</p> <p>O4 Possible endometrial adenocarcinoma</p>
----------------------	---

Record this code if endometrial adenocarcinoma is suspected, but a confident prediction is not possible.

O5 Possible high-grade lesion – non cervical

Record this code if abnormal cells are present but do not appear to be cervical in origin.

O6 Malignant cells – uterine body

Record this code when malignant endometrial cells are present.

O7 Malignant cells – vagina

Record this code if malignant cells are present in a vaginal or vault cytology specimen.

O8 Malignant cells – ovary

Record this code if malignant ovarian cells are present.

O9 Malignant cells – other

Record this code if malignant cells are present which belong to none of the above categories.

OU Due to the unsatisfactory nature of the cytology specimen, no assessment has been made

Record this code when the specimen is unable to be assessed due to poor cellularity, poor preservation, cell detail obscured by blood/inflammation/degenerate cells. If a specimen is suboptimal but atypical/abnormal cells are detected, the abnormality overrides the unsatisfactory coding and should be coded to reflect the abnormality detected.

#### **Collection and usage attributes**

<i>Guide for use</i>	<p>When cytology takes the form of a reflex LBC to be combined with an HPV test to assign a screening episode result, squamous and endocervical (glandular) cytology test results are summarised into a single LBC test result to allow a risk of significant cervical abnormality to be allocated, and a clinical recommendation to be determined according to the clinical guidelines. The clinical guidelines include LBC test results of 'Unsatisfactory', 'Negative', 'pLSIL/LSIL', 'pHSIL/HSIL+', and 'Any glandular abnormality'. These LBC test results are defined as:</p> <ul style="list-style-type: none"><li>• Unsatisfactory: I5 = SU and I6 = (EU or E- or E0 or E1)</li><li>• Negative: I5 = S1 and I6 = (EU or E- or E0 or E1)</li><li>• pLSIL/LSIL: I5 = S2 or S3 and I6 &lt; E2</li><li>• pHSIL/HSIL+: I5 = S4 or S5 or S6 or S7 and I6 &lt; E2</li><li>• Any glandular abnormality: I5 = SU or S1 or S2 or S3 or S4 or S5 or S6 or S7 and I6 = E2 or E3 or E4 or E5 or E6</li></ul> <p>Note that according to these LBC test results definitions, a result of I5 = S7 and I6 = E2 will have a single LBC test result of 'Any glandular abnormality', not 'pHSIL/HSIL+'.</p>
<i>Comments</i>	<i>Collected by pathology laboratories.</i>

## J1 Primary screening episode commencement date

---

### Identifying and definitional attributes

<i>Data item name</i>	Primary screening episode commencement date
<i>Definition</i>	The date the primary screening episode commenced.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Date
<i>Data type</i>	Date/Time
<i>Format</i>	DDMMYYYY
<i>Maximum character length</i>	8

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	The primary screening episode date is the date on which the sample was collected for the primary screening HPV test. Where the HPV test is on a self-collected sample and a second sample for LBC collected by a healthcare provider, the primary screening episode date should be the date of the HPV test and not the LBC test.
<i>Collection methods</i>	This date can be derived by H1 'HPV test date' where H4 'Reason for HPV test' = C1

#### Relational attributes

<i>Related metadata reference</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> J1 Primary screening episode commencement date

<i>Representation class</i>	Date
<i>Data type</i>	Date/Time
<i>Format</i>	DDMMYYYY
<i>Maximum character length</i>	8

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>The primary screening episode completion date is the date on which there was a valid HPV test and a valid LBC test (where this is required) to allow a risk rating to be assigned.</p> <p>For most participants the primary screening episode completion date will be identical to the primary screening episode commencement date. Where a second sample for LBC needs to be collected by a healthcare provider, either because of an unsatisfactory LBC test or because the HPV test was on a self-collected sample, there can be some time between the primary screening episode commencement date and the primary screening episode completion date.</p>
<i>Collection methods</i>	This is a derived date.
<i>Comments</i>	This data item should be used when determining time between primary screening episode and follow-up events.

#### Collection and usage attributes

<i>Guide for use</i>	<p>An HPV test is the primary screening test of the renewed National Cervical Screening Program. However, this is used in conjunction with partial genotyping of the HPV test to distinguish between oncogenic HPV 16/18 and oncogenic HPV (not 16/18), as well as triage of all oncogenic HPV results (16/18 and not 16/18) with reflex liquid-based cytology (LBC). This means that the overall screening episode result is a combination of the primary screening HPV test result and the LBC result (where performed).</p> <p>It also means that it is possible for a participant to have an incomplete screening episode (and therefore no overall result or risk rating assigned). This can be either due to an unsatisfactory</p>
----------------------	--

HPV test or LBC test (which was not repeated), or due to a participant with a self-collected sample testing positive for HPV who then did not have a sample collected for the reflex LBC test. Complete primary screening episode results are comprised of an HPV test result and (unless the result was 'oncogenic HPV not detected') a reflex LBC test result.

*Collection methods*

Primary screening HPV test results and LBC test results are derived from the HPV test and cytology test sections.

*Comments*

Categories that include 'not performed' or 'unsatisfactory' can change as tests that are required are performed.

The primary screening episode is not complete until receipt of a valid test.

Value	Meaning						
Q0	Inadequate						
Q1	Adequate						

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	'Adequate' indicates that the view of the cervix is not obscured. 'Inadequate' indicates that the cervix cannot be adequately visualised, for example due to inflammation, bleeding, atrophy, or scar tissue.
<i>Collection methods</i>	Colposcopy Data Collection Form.
<i>Comments</i>	The terms 'satisfactory' and 'unsatisfactory' for describing a colposcopy have been replaced with a two-tiered system. The first tier relates to the visibility of the cervix, either adequate for the reason or inadequate if it is obscured, such as by blood, inflammation, or scarring, and is the colposcopic assessment captured in this data item. The second tier relates to the visibility of the transformation zone. A Type 1 transformation zone is completely visible and the squamocolumnar junction is completely seen. A Type 2 transformation zone is also completely visible and the squamocolumnar junction is in the endocervical canal, but can be seen. A Type 3 transformation zone is not completely visible and the squamocolumnar junction cannot be seen.

#### Collection and usage attributes

<i>Guide for use</i>	<p>This data item is derived by the AIHW for use in performance indicator reporting that requires colposcopy data.</p> <p>There are four sources of information that a colposcopy has occurred across National Cancer Screening Register data tables.</p> <p>'1 Colposcopy Data Collection Form' indicates that the source is the colposcopy form that is completed and provided to the NCSR. This is the only source that can have all colposcopy and treatment data items populated.</p> <p>'2 MBS' indicates that the source is the Medicare Benefits Scheme. The only data item that can be populated when MBS is the source is 'K1 Date of colposcopy episode'.</p> <p>'3 Abnormal result questionnaire' indicates that the source is the Abnormal result questionnaire. Data items that can be populated from this source are 'K1 Date of colposcopy episode', 'K8 Biopsy this episode' and 'K9 Pregnancy flag'.</p> <p>'4 Histology' indicates that the source is histology data, since if a histological sample was collected there must have been a colposcopy. The only data item that can be populated when histology is the source is 'K1 Date of colposcopy episode'.</p> <p>'9 Unknown' indicates the source of the colposcopy is unknown.</p>
----------------------	--

*Comment*

This does not prescribe how others collect and use colposcopy data, only how the AIHW collect and use colposcopy data.

*Collection methods*

Where there is more than one data source for a single colposcopy, an order of priority is used to allow the most information to be collected about the colposcopy. The order of priority would be to select a colposcopy form record over an MBS record, as a greater number of colposcopy and treatment data items can be populated.

#### Collection and usage attributes

<i>Comments</i>	<p>Histology nomenclature was revised in the <i>National Cervical Screening Program: Guidelines for the management of screen-detected abnormalities, screening in specific populations and investigation of abnormal vaginal bleeding</i> (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party).</p> <p>A two-tiered nomenclature system has been accepted for non-invasive HPV associated squamous proliferations of the cervix. The two groups are LSIL and HSIL, which may be further characterised by the applicable cervical intraepithelial neoplasia (CIN) subcategory.</p> <p>LSIL is the morphologic expression of acute HPV infection. LSIL encompasses changes previously called 'HPV effect' and 'CIN1'.</p>
-----------------	--

HSIL is the morphologic expression of persistent HPV infection that has the potential to progress to invasive carcinoma. HSIL encompasses lesions previously called 'CIN2' and 'CIN3'.

The subcategories HSIL (CIN2) and HSIL (CIN3) should continue to be used.

Where a pathologist is considering a diagnosis of CIN2, p16 staining should be performed. If the p16 stain is negative, the lesion is either LSIL or a mimic of HSIL and should not be diagnosed as HSIL. If the p16 stain is positive, the lesion should be diagnosed as HSIL (CIN2).

The term 'microinvasive carcinoma' is no longer recommended, and the term 'superficially invasive squamous cell carcinoma' (SISCCA) should be used instead.

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>Note that for the purposes of national reporting of cervical histology by the Australian Institute of Health and Welfare, categories are based only on S and E codes.</p> <p>An unsatisfactory histology result is defined as specified in each state or territory, since the entire pathology result is required to make an evaluation. For instance, the overall findings may be unsatisfactory, even if there are valid squamous and endocervical (glandular) codes allocated, since a pathologist may code what can be observed, even in the case of an unsatisfactory sample. Hence it is not appropriate to define unsatisfactory histology using S and E codes.</p> <p>Note, however, that if high-grade or malignant cells are seen in an otherwise unsatisfactory specimen, the histology result category should reflect the high-grade or malignant finding, rather than the unsatisfactory nature of the sample.</p> <p>A negative histology result is defined as any histology test that is not unsatisfactory and where there is no evidence of HPV infection, intraepithelial pre-neoplasia, or intraepithelial neoplasia.</p> <p>Note that there is no requirement for both squamous and endocervical (glandular) components to be sampled and to be negative; a histology result that only samples the squamous</p>
----------------------	--

component and the squamous component is negative, or a histology result that only samples the endocervical (glandular) component and the endocervical (glandular) component is negative, are both counted as negative histology tests.

A negative histology result can therefore be represented as (L4 = S1 and L5 = E1) or (L4 = S1 and L5 = EN) or (L4 = SN and L5 = E1), although this may not reflect how negative histology is coded by cervical screening registers.

A low-grade histology result is defined as L4 = S2 or L5 = E2 (L4 cannot be >S2 and L5 cannot be >E2).

A high-grade histology result is defined as L4 = S3 or L5 = E3 (L4 cannot be >S3 and L5 cannot be >E3).

A cervical cancer histology result is defined as L4 = S4 or L5 = E4.

*Comments*

This is the way that histology results are used for reporting and monitoring purposes.

Some histology results do not have valid S and E. Where both the S and E code are invalid (such as 'not applicable'), the code DN can be used to capture these tests for which there is no result.

## M11 Test of cure completion flag

---

### Identifying and definitional attributes

<i>Data item name</i>	Test of cure completion flag
<i>Definition</i>	An indication that, following treatment for a high-grade squamous intraepithelial lesion, a participant has completed test of cure.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code				
<i>Data type</i>	Number				
<i>Format</i>	{N}				
<i>Maximum character length</i>	1				
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Test of cure complete</td></tr></tbody></table>	Value	Meaning	1	Test of cure complete
Value	Meaning				
1	Test of cure complete				

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	Successful completion of test of cure is as per the management guidelines and comprises two negative co-test (HPV and LBC) results 12 months apart, commencing 12 months after treatment for a histologically confirmed high-grade squamous intraepithelial lesion.
<i>Comments</i>	A negative co-test is defined as an HPV test and cytology test performed on the same day where the HPV test result is 'no oncogenic HPV types detected' and the cytology test result is 'S1 Cell numbers and preservation satisfactory. No abnormality or only reactive changes' and 'E0 No endocervical component', 'E1 Endocervical component present. No abnormality or only reactive changes', 'EU Due to the unsatisfactory nature of the cytology specimen, no assessment has been made', or 'E- Not applicable: vault smear/previous hysterectomy'.

## Group N: Provider data items

Provider data items allow the collection and reporting by provider for all tests that may be performed within a screening round – HPV tests, cytology tests, colposcopy, and histology tests. These can be used in combination with the data item *Type of test* to determine the provider details for each test.

- N1 Medicare provider number of provider requesting a test
- N2 Healthcare provider identifier – individual (HPI-I) of provider requesting a test
- N3 Healthcare provider identifier – organisation (HPI-O) of provider requesting a test
- N4 Australian state/territory of provider requesting a test
- N5 Australian postcode of provider requesting a test
- N6 Medicare provider number of provider collecting a specimen
- N7 Non-medical provider number of provider collecting a specimen
- N8 Healthcare provider identifier – individual (HPI-I) of provider collecting a specimen
- N9 Healthcare provider identifier – organisation (HPI-O) of provider collecting a specimen
- N10 Type of provider collecting a specimen
- N11 Australian state/territory of provider collecting a specimen
- N12 Australian postcode of provider collecting a specimen

---

# N1 Medicare provider number of provider requesting a test

---

## Identifying and definitional attributes

<i>Data item name</i>	Medicare provider number of provider requesting a test
<i>Definition</i>	The Medicare provider number of the provider requesting a test.
<i>Collection status</i>	Essential

## Value domain attributes

---

<i>Representation class</i>	Identifier
<i>Data type</i>	String
<i>Format</i>	X[X(7)]
<i>Maximum character length</i>	8

## Data item attributes

---

### Collection and usage attributes

<i>Guide for use</i>	<p>The provider requesting test is the provider responsible for the test.</p> <p>The Medicare provider number of the provider requesting a test is therefore the Medicare provider number of the provider who is responsible for the test. Only general practitioners, nurse practitioners and specialists have a Medicare provider number, and can therefore be considered responsible for the test.</p> <p>A health professional can have more than one Medicare provider number, as they will have a Medicare provider number at each location at which they work. Medicare provider numbers are comprised of 8 characters, the first 6 of which are the same for each provider, with subsequent characters used for different locations.</p> <p>The Medicare provider number is not always known or available. In these cases, a dummy provider number unique to the practitioner may be used. A generic dummy value of 0000000Y may also be used, if there is no requirement for the dummy number to be unique to the practitioner. Following a participant being referred to a colposcopist or specialist it may also be necessary for the provider number to be changed for contact purposes to reflect ongoing care by the provider, until any further information is received.</p>
<i>Rules for use</i>	<p>As the provider responsible for the test should have a Medicare provider number this field should always be populated.</p>
<i>Comments</i>	<p>Medicare provider numbers are allocated to individual providers and organisations to support payments and claims through government schemes such as Medicare Benefits and Pharmaceutical Benefits Schemes.</p> <p>For screening tests, the provider requesting the test may not be the provider who collects the specimen; for example, a nurse may collect a sample.</p>

## N5 Australian postcode of provider requesting a test

---

### Identifying and definitional attributes

<i>Data item name</i>	Australian postcode of provider requesting a test
<i>Definition</i>	The code that represents a postal delivery area, aligned with locality, suburb, or place for the practice where a provider requesting a test is located.
<i>Collection status</i>	Desirable

### Value domain attributes

---

<i>Representation class</i>	Code
<i>Data type</i>	String
<i>Format</i>	{NNNN}
<i>Maximum character length</i>	4

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	Must accept zero as the leading digit to accommodate all Australian postcodes.
<i>Comments</i>	Australian postcode may be used in the analysis of data on a geographical basis, which involves a conversion from postcodes to the Australian Bureau of Statistics (ABS) postal areas. This conversion results in some inaccuracy of information. However, in some data sets postcode is the only geographic identifier, therefore the use of other more accurate indicators is not always possible. When dealing with aggregate data, postal areas, converted from postcodes, can be mapped to Australian Statistical Geography Standard codes using an ABS concordance.

#### Relational attributes

<i>Related metadata references</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> N5 Australian postcode of provider requesting a test
------------------------------------	--

---

---

## N6 Medicare provider number of provider collecting a specimen

## **Group P: Screening history data items**

- P1 Previously screened flag
- P2 Date of last screening test
- P3 Last screening test type
- P4 Number of days since last screening test

---

## P1 Previously screened flag

---

### Identifying and definitional attributes

<i>Data item name</i>	Previously screened flag
<i>Definition</i>	An indication as to whether a person has ever had a screening test.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code				
<i>Data type</i>	Number				
<i>Format</i>	{N}				
<i>Maximum character length</i>	1				
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Previously screened</td></tr></tbody></table>	Value	Meaning	1	Previously screened
Value	Meaning				
1	Previously screened				

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	This flag should be used for any person who has ever had a screening test – either a Pap test through the previous National Cervical Screening Program or an HPV test through the current National Cervical Screening Program.
	Exclude diagnostic or follow-up tests.
<i>Collection methods</i>	This data item is derived.
<i>Comments</i>	If never previously screened, this flag should be raised when a person has their first screening test.
<i>Rules for use</i>	If P2 'Date of last screening test' is not NULL, P1 'Previously screened flag' should be = 1.

### Relational attributes

<i>Related metadata reference</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> P1 Previously screened flag
-----------------------------------	---

---

---

## P2 Date of last screening test

---

### Identifying and definitional attributes

<i>Data item name</i>	Date of last screening test
<i>Definition</i>	The date a sample for a participant's last screening test was collected (date of screening test).
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Date
<i>Data type</i>	Date/Time
<i>Format</i>	{DDMMYYYY}
<i>Maximum character length</i>	8

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>This will need to be updated each time a participant has a screening test so that this reflects their most recent screening test date.</p> <p>If a histology diagnosis of cervical cancer is received by the National Cancer Screening Register with a collection date within 6 months of the date of a previous screening test, this date needs to be replaced with the immediately preceding screening test date until there is a screening test that is not followed by a diagnosis of cervical cancer within 6 months. If this was the participant's first screening test date, or if there is no screening test that is not followed by a cancer diagnosis within 6 months, then it should be reverted to NULL, and P1 flag removed.</p> <p>This is to collect screening tests only. Screening tests that lead to a histological diagnosis of cancer within 6 months are likely to be part of the diagnosis process, rather than a true screen. These tests are important to remove, as this data item will be used to determine whether a person has an interval cancer diagnosed, and the inclusion of these would falsely elevate the number of interval cancers.</p> <p>Diagnosis of cervical cancer must be by histology (L7 = 4).</p> <p>Includes Pap tests under the previous National Cervical Screening Program and screening HPV tests under the current National Cervical Screening Program.</p>
<i>Collection methods</i>	This data item is derived.
<i>Rules for use</i>	If P1 'Previously screened flag' = 1, P2 'Date of last screening test' should not be NULL.
<i>Comments</i>	Date of previous screening test can be combined with date of diagnosis of cervical cancer to assign a screening history to a person diagnosed with cervical cancer (for example, never

screened, lapsed screening, adequately screened) based on time since last screening test at time of diagnosis with cervical cancer.

### **Relational attributes**

*Related metadata reference*      Supersedes *National Cervical Screening Program data dictionary version 1.1 P2* Date of last screening test

---

---

## P3 Last screening test type

---

### Identifying and definitional attributes

<i>Data item name</i>	Last screening test type
<i>Definition</i>	An indication as to whether the last screening test was a cytology test or an HPV test.
<i>Collection status</i>	Conditional

### Value domain attributes

---

<i>Representation class</i>	Code						
<i>Data type</i>	String						
<i>Format</i>	{A}						
<i>Maximum character length</i>	1						
<i>Permissible values</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>V</td><td>HPV test</td></tr><tr><td>C</td><td>Cytology test</td></tr></tbody></table>	Value	Meaning	V	HPV test	C	Cytology test
Value	Meaning						
V	HPV test						
C	Cytology test						

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	Cytology test should be selected where the last screening test is a screening cytology test under the previous National Cervical Screening Program. HPV test should be selected where the last screening test is an HPV test under the current National Cervical Screening Program.
<i>Collection methods</i>	The data item is derived.
<i>Rules for use</i>	P3 'Last screening test type' can only be populated if P1 'Previously screened flag' = 1, otherwise this data item should be left blank.

#### Relational attributes

<i>Related metadata reference</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> P3 Last screening test type
-----------------------------------	---

---

---

## P4 Number of days since last screening test

---

### Identifying and definitional attributes

<i>Data item name</i>	Number of days since last screening test
<i>Definition</i>	The number of days that have passed since the last recorded screening test for a participant.
<i>Collection status</i>	Essential

### Value domain attributes

---

<i>Representation class</i>	Code
<i>Data type</i>	Number
<i>Format</i>	N[NNNNN]
<i>Maximum character length</i>	6

### Data item attributes

---

#### Collection and usage attributes

<i>Guide for use</i>	<p>This is the number of days since a participant's last screening test, calculated by subtracting the date of test/collection of the last screening test from the current date.</p> <p>When a new screening test occurs, this should be set to 0.</p> <p>The number of days will increase by one day every day.</p> <p>Number of days should be set to 999999 if no previous screening test is recorded (when P2 'Date of last screening test' is NULL).</p>
<i>Collection methods</i>	Derived from P2 'Date of last screening test' and current date.
<i>Comments</i>	This is used to determine the screening history of a person, as never-screeners, lapsed screeners, regular screeners etcetera, based on time since a person's last screening test.

#### Relational attributes

<i>Related metadata reference</i>	Supersedes <i>National Cervical Screening Program data dictionary version 1.1</i> P4 Number of days since last screening test

## **4 Screening and follow-up episode result tables**

The following tables were developed to assist with the classification of:

- Screening episodes; and
- Follow-up episodes.

Primary screening HPV test result	Cytology test result	Screening episode risk	
Unsatisfactory	..	Unsatisfactory	
	Oncogenic HPV types not detected	Low risk	
Oncogenic HPV (not 16/18)	None (applies to self-collected samples only)		
	Unsatisfactory	Unsatisfactory	
HPV 16/18	Negative	Intermediate risk	→
	Possible or definite low-grade intraepithelial lesion (LSIL)	Intermediate risk	→
	Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer	Higher risk	
	Any glandular abnormality	Higher risk	
	None (applies to self-collected samples only)	Higher risk	
	Unsatisfactory	Higher risk	
	Negative	Higher risk	
	Possible or definite low-grade intraepithelial lesion (LSIL)	Higher risk	
	Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer	Higher risk	
	Any glandular abnormality	Higher risk	

First follow-up (repeat HPV test in 12 months)

Risk	First follow-up HPV test result	Cytology test result	Follow-up episode risk	
Intermediate risk	Unsatisfactory	..	Unsatisfactory	
	Oncogenic HPV types not detected	..	Low risk	
	Oncogenic HPV (not 16/18)	None (applies to self-collected samples only)		
		Unsatisfactory		Unsatisfactory
		Negative		Intermediate risk
		Possible or definite low-grade intraepithelial lesion (LSIL)		Intermediate risk
		Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer		Higher risk
		Any glandular abnormality		Higher risk
	HPV 16/18	None (applies to self-collected samples only)		Higher risk
		Unsatisfactory		Higher risk
		Negative		Higher risk
		Possible or definite low-grade intraepithelial lesion (LSIL)		Higher risk
		Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer		Higher risk
		Any glandular abnormality		Higher risk

Second follow-up (repeat HPV test in 12 months)

Exceptions to this are participants who are 2 or more years overdue for screening at the time of the initial screen, participants who identify as being Aboriginal and/or Torres Strait Islander, and participants aged 50 years or older, who should instead be referred to colposcopy if any HPV is detected at 12 months.

Risk	Second follow-up HPV test result	Cytology test result	Follow-up episode risk
Intermediate risk	Unsatisfactory	..	Unsatisfactory
	Oncogenic HPV types not detected	..	Low risk
	Oncogenic HPV (not 16/18)	None (applies to self-collected samples only)	Higher risk
		Unsatisfactory	Higher risk
		Negative	Higher risk
		Possible or definite low-grade intraepithelial lesion (LSIL)	Higher risk
		Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer	Higher risk
		Any glandular abnormality	Higher risk
	HPV 16/18	None (applies to self-collected samples only)	Higher risk
		Unsatisfactory	Higher risk
		Negative	Higher risk
		Possible or definite low-grade intraepithelial lesion (LSIL)	Higher risk
		Possible or definite high-grade intraepithelial lesion (HSIL) or cervical cancer	Higher risk
		Any glandular abnormality	Higher risk

## 5 Performance indicators

With the major changes that the renewed NCSP has brought, including an HPV test every five years and a commencement age of 25 years, there was a need to develop new performance indicators for the renewed NCSP that would continue to meet the need for national monitoring of this important screening program. These new performance indicators were developed concurrently with the development of new quality measures, safety monitoring measures, as well as measures that are external to the NCSP (such as performance measures for pathology laboratories).

These new performance indicators were developed by the AIHW in consultation with the Department of Health and state and territory cervical screening programs, the NCSP Quality and Safety Monitoring Committee, the Colposcopy Working Group, and cervical screening experts Professors Ian Hammond, Marion Saville, Julia Brotherton, David Roder, and Dorota Gertig.

Performance indicators have been revised since their introduction, to reflect a revised definition of participation (and the introduction of a new coverage measure to replace the previously defined participation), and to incorporate a change to the screening pathway for intermediate risk participants in 2021 and the removal of eligibility requirements for self-collection on 1 July 2022.

The performance indicators for the renewed NCSP are listed in Table 5.1.

**Table 5.1: Performance indicators for the renewed National Cervical Screening Program**

Screening pathway	Performance indicator
Recruitment	1 Participation
	2 Response to invitation
	3 Rescreening
Screening	4 Screening results
	5 Correlation of screening results
	6 Screening HPV test positivity
	7 Cervical cancer diagnosed after a low risk screening test result
	8 LBC test in self-collection participants positive for oncogenic HPV (not 16/18)
	9 Colposcopy in self-collection participants positive for oncogenic HPV 16/18
	10 Adherence to recommendation for follow-up
Follow-up	11 Follow-up results
	12 Colposcopy rate
Assessment	13 Time to colposcopy
	14 Biopsy rate
	15 Yield of high-grade abnormalities on biopsy among participants who attend colposcopy with higher risk screening results
	16 Positive predictive value of colposcopy
	17a High-grade cervical abnormality detection rate
Diagnosis	17b Cervical cancer detection rate
	18 Cervical cancers diagnosed by time since last screen
Outcomes	19 Incidence of cervical cancer
	20 Mortality from cervical cancer

## Disaggregation of performance indicators

### Age groups

All performance indicators are defined for the target age group 25–74. Note 25 years is calculated as 24 years and 9 months since this is the age at which people are invited to first screen.

Where appropriate, performance indicators will also be reported separately for birth cohorts that represent whether or not a participant was offered HPV vaccination. Participants not offered HPV vaccination are defined as those born on or before 30 June 1980; participants offered HPV vaccination are defined as those born after 30 June 1980 (1 July 1980 onwards).

### Population groups

Performance indicators will be disaggregated, where appropriate, by state and territory of residence, remoteness area of residence, socioeconomic area of residence, Indigenous status, CALD status and HPV vaccination status.

## Notes for performance indicators

### Cervical screening tests

All screening and histology tests are limited to those associated with cervical screening.

For **screening tests**, cervical screening tests are defined as:

- practitioner-collected samples where HPV test specimen site is NOT *Vaginal* or *Other gynaecological site* (allows *Not stated*, *Cervical* and NULL); and
- self-collected samples where HPV test specimen site is NOT *Other gynaecological site* (allows *Not stated*, *Cervical*, *Vaginal* and NULL).

Requires *H2 HPV test collection method*; *H3 HPV test specimen site*.

Vault smears are excluded, defined as:

- cytology tests where cytology test specimen site is *Vaginal* and cytology test endocervical (glandular) cytology cell analysis result is *vault smear/previous hysterectomy*.

Requires *I3 Cytology test specimen site*; *I6 Cytology test endocervical (glandular) cytology cell analysis*.

For **histology tests**, cervical screening tests are defined as:

- samples where site is NOT *Vaginal* or *Other gynaecological site* (allows *Not stated*, *Cervical* and NULL).

Further, as a histology result is required for performance indicators that use histology, only histology data where the source is a pathology laboratory are included.

Requires *L2 Histology test specimen site*; *L11 Histology data source*.

### Data quality and completeness

Specifications for performance indicators assume a level of data quality and completeness that is sufficient to allow robust and meaningful data to be reported. Where there are concerns about data quality and completeness, and/or where data items required are not available, aspects of performance indicators that have been specified in this document will not be reported.

Indicator 1 Participation

Definition:

Number of participants aged 25–74 screened in a 5-year period as a percentage of eligible females in the population.

Rationale:

Higher participation in cervical screening means that more precancerous abnormalities can be detected and treated, which is necessary for achieving the overall aim of reducing incidence and mortality from cervical cancer.

Calculation:

**Participation**

$$\frac{\text{Number of participants aged 25– 74 who had at least one primary screening or follow- up HPV test in a 5- year period} \times 100}{\text{Estimated resident population for females aged 25– 74 averaged over the 5 years of the reporting period, adjusted for the estimated proportion of females who have had a hysterectomy}}$$

**Coverage**

$$\frac{\text{Number of participants aged 25– 74 who had at least one HPV test or cytology test for any reason in a 5- year period} \times 100}{\text{Estimated resident population for females aged 25– 74 averaged over the 5 years of the reporting period, adjusted for the estimated proportion of females who have had a hysterectomy}}$$

Count is of participants

Specifications:

Participation

Numerator specifications

<i>Definition</i>	Number of participants aged 25–74 who had at least one primary screening or follow-up HPV test in a 5-year period

<i>Data items</i>	A1 Participant identifier B4 Date of birth G1 Type of test = V <i>HPV test</i> or C <i>Cytology test</i> H1 HPV test date I1 Cytology test date

### Denominator specifications

---

<i>Definition</i>	Estimated resident population for females aged 25–74 averaged over the 5 years of the reporting period, adjusted for the estimated proportion of females who have had a hysterectomy
<i>Source</i>	Australian Bureau of Statistics; AIHW National Hysterectomy Fractions

## Indicator 2 Response to invitation

### Definition:

Percentage of invitees aged 25–74 invited to screen or rescreen in a calendar year who screened within 6 months.

### Rationale:

How many invitees screen in response to an invitation provides a measure of the effectiveness of sending invitations. Measuring this by mode of invitation will also provide useful information as to the most effective method of invitation (which may differ by age or other factors).

### Calculation:

$$\frac{\text{Number of invitees aged 25–74 invited to screen or rescreen in a calendar year who had a primary screening HPV test within 6 months of the invitation being sent}}{\text{Number of invitees aged 25–74 invited to screen or rescreen in a calendar year}} \times 100$$

Numerator is a subset of the denominator

Count is of invitees

### Specifications:

#### Numerator specifications

<i>Definition</i>	Number of invitees aged 25–74 invited to screen or rescreen in a calendar year who had a primary screening HPV test within 6 months
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier F2 Correspondence date G1 Type of test = V <i>HPV test</i> H4 Reason for HPV test = C1 <i>Primary screening HPV test</i> H1 HPV test date

#### Denominator specifications

<i>Definition</i>	Number of invitees aged 25–74 who are invited to screen or rescreen through the NCSP in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth F1 = Correspondence type = A1 <i>Screening invitation</i> or B1 <i>Screening invitation – self collection eligible*</i> or C1 <i>Rescreening invitation</i> or D1 <i>Rescreening invitation – self-collection eligible*</i> F2 Correspondence date * self-collection eligible correspondence only applicable before 1 July 2022

## Indicator 3 Rescreening

### Definition:

Percentage of participants aged 25–69 whose screening HPV test in the index calendar year did not detect oncogenic HPV who rescreened within a specified period of time.

### Rationale:

The proportion of the target population screened within the recommended screening interval is a key determinant of the success of a screening program; screening more frequently increases costs with minimal or no gain in a reduction in incidence and mortality; screening less frequently results in a decrease in overall participation in screening and means that fewer precancerous abnormalities can be detected and treated, necessary for achieving the overall aim of reducing incidence and mortality from cervical cancer. This indicator measures the proportion of participants who rescreened early, appropriately, or late.

Note that although the National Cervical Screening Program target age group is 25–74, only participants aged 25–69 are reported for rescreening because participants aged 70–74 at the time of their screen would be outside the target age group of 25–74 when they are due for their 5-year rescreen.

### Calculation:

#### Early rescreening

$$\frac{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV who had a primary screening HPV test } < 4 \text{ years and 9 months}}{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV}} \times 100$$

#### Adequate rescreening: on time

$$\frac{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV who had a primary screening HPV test } \geq 4 \text{ years and 9 months and } \leq 5 \text{ years 3 months}}{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV}} \times 100$$

#### Adequate rescreening: overdue

$$\frac{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV who had a primary screening HPV test } > 5 \text{ years and 3 months and } \leq 6 \text{ years}}{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV}} \times 100$$

#### Late rescreening

$$\frac{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV who had a primary screening HPV test } > 6 \text{ years}}{\text{Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV}} \times 100$$

Numerator is a subset of the denominator

Count is of participants

**Specifications:**

Numerator specifications

---

<i>Definition</i>	Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV who had a primary screening HPV test < 4 years 9 months, ≥ 4 years 9 months and ≤ 5 years 3 months, > 5 years 3 months ≤ 6 years, or > 6 years
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier G1 Type of test = V <i>HPV test</i> H1 HPV test date H4 Reason for HPV test = C1 <i>Primary screening HPV test</i>

Denominator specifications

---

<i>Definition</i>	Number of participants aged 25–69 whose primary screening HPV test in the index calendar year did not detect oncogenic HPV
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth G1 Type of test = V <i>HPV test</i> H1 HPV test date H4 Reason for HPV test = C1 <i>Primary screening HPV test</i> H5 HPV test result – oncogenic HPV = D0 <i>Oncogenic HPV not detected</i>

## Indicator 4 Screening results

**Definition:**

Percentage of screening episodes in participants aged 25–74 in each risk category in a calendar year.

**Rationale:**

Distribution of screening episode results is a key measure for the screening program and any changes in these distributions over time will require investigation within the broader context of the screening program.

**Calculation:**

**Unsatisfactory**

$$\frac{\text{Number of primary screening episodes that were unsatisfactory in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of primary screening episodes in participants aged 25– 74 in a calendar year}}$$

**Low risk**

$$\frac{\text{Number of primary screening episodes that were low risk in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of primary screening episodes in participants aged 25– 74}}$$

**Intermediate risk**

$$\frac{\text{Number of primary screening episodes that were intermediate risk in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of primary screening episodes in participants aged 25– 74 in a calendar year}}$$

**Higher risk**

$$\frac{\text{Number of primary screening episodes that were higher risk in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of primary screening episodes in participants aged 25– 74 in a calendar year}}$$

Count is of primary screening episodes

**Specifications:**

Numerator specifications

---

<i>Definition</i>	Number of primary screening episodes in participants aged 25–74 in a calendar year that had a risk of significant cervical abnormality of: unsatisfactory low risk intermediate risk higher risk
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth J1 Primary screening episode commencement date J4 Primary screening episode test risk of significant cervical abnormality

Denominator specifications

---

<i>Definition</i>	Number of primary screening episodes in participants aged 25–74 in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth J1 Primary screening episode commencement date

## Indicator 5 Correlation of screening results

### Definition:

Level of agreement between screening results in participants aged 25–74 in a calendar year and subsequent histology test results within 6 months.

### Rationale:

The correlation between a positive screening test result and the histology test or 'truth' (where this is performed) is a key measure of the accuracy of the HPV test, LBC test, and overall risk assigned to a screening episode.

### Calculation:

$$\frac{\text{Histology test results within 6 months}}{\text{Primary screening episode results in participants aged 25–74 in a calendar year that are followed by a histology test within 6 months}}$$

Primary screening episode results in participants aged 25–74 in a calendar year that are followed by a histology test within 6 months

This calculation is applied cell by cell for each primary screening HPV+LBC result and each histology result, such that the number of tests in each histology result category that corresponds with each HPV+LBC result category is reported in a grid

Numerator is a subset of the denominator

Count is of tests

**Specifications:**

**Numerator specifications**

---

<i>Definition</i>	Histology test results within 6 months
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier G1 Type of test = H <i>Histology test</i> J2 Primary screening episode completion date L1 Histology test date L7 Histology test result Histology test result categories: Negative DN No result DU Unsatisfactory D1 Negative D2 Low-grade D3 High-grade D4 Cervical cancer

**Denominator specifications**

---

<i>Definition</i>	Primary screening episode results followed by histology within 6 months in participants aged 25–74 in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth H4 Reason for HPV test = C1 <i>Primary screening HPV test</i> J1 Primary screening episode commencement date J2 Primary screening episode completion date J3 Primary screening episode result Primary screening episode result categories: U Unsatisfactory HPV test 1 Oncogenic HPV not detected 2.X Oncogenic HPV (not 16/18) + LBC not performed 2.0 Oncogenic HPV (not 16/18) + unsatisfactory LBC 2.1 Oncogenic HPV (not 16/18) + negative LBC 2.2 Oncogenic HPV (not 16/18) + pLSIL/LSIL LBC 2.3 Oncogenic HPV (not 16/18) + pHSIL/HSIL+ LBC 2.4 Oncogenic HPV (not 16/18) + any glandular abnormality LBC 3.X HPV16/18 + LBC not performed 3.0 HPV16/18 + unsatisfactory LBC 3.1 HPV16/18 + negative LBC 3.2 HPV16/18 + pLSIL/LSIL LBC 3.3 HPV16/18 + pHSIL/HSIL+ LBC 3.4 HPV16/18 + any glandular abnormality LBC

**Indicator 6 Screening HPV test positivity**

**Definition:**

Percentage of valid screening HPV tests that are positive for oncogenic HPV in participants aged 25–74 in a calendar year.

**Rationale:**

Monitoring the positivity rate provides important information about a screening test. There are three measures of positivity relevant to the NCSP; any oncogenic HPV positivity is the proportion of valid HPV test that are positive for any oncogenic HPV type, oncogenic HPV 16/18 positivity is the proportion of valid HPV tests that are positive for oncogenic HPV 16/18, and oncogenic HPV (not 16/18) positivity is the proportion of valid HPV tests that are positive for oncogenic HPV (not 16/18).

**Calculation:**

**Any oncogenic HPV positivity rate**

$$\frac{\text{Number of valid primary screening HPV tests in which any oncogenic HPV type is detected in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of valid primary screening HPV tests in participants aged 25– 74 in a calendar year}}$$

**Oncogenic HPV 16/18 positivity rate**

$$\frac{\text{Number of valid primary screening HPV tests in which oncogenic HPV 16/18 is detected in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of valid primary screening HPV tests in participants aged 25– 74 in a calendar year}}$$

**Oncogenic HPV (not 16/18) positivity rate**

$$\frac{\text{Number of valid primary screening HPV tests in which oncogenic HPV (not 16/18) is detected in participants aged 25– 74 in a calendar year} \times 100}{\text{Number of valid primary screening HPV tests in participants aged 25– 74 in a calendar year}}$$

Count is of valid primary screening HPV tests

**Specifications:**

**Numerator specifications**

---

<i>Definition</i>	Number of valid screening HPV tests in participants aged 25–74 in a calendar year in which: any oncogenic HPV detected oncogenic HPV 16/18 detected oncogenic HPV (not 16/18) detected

## Indicator 7 Cervical cancer diagnosed after a low risk screening test result

### Definition:

Percentage of participants aged 25–74 who are diagnosed with cervical carcinoma within 5 years of a screening HPV test that did not detect oncogenic HPV.

### Rationale:

This measures the false negative rate of a low risk primary screening HPV test result.

### Calculation:

$$\frac{\text{Number of participants with cervical carcinoma diagnosed within 5 years of a primary screening HPV test that did not detect oncogenic HPV in a calendar year} \times 100}{\text{Number of participants aged 25–74 who had a primary screening HPV test that did not detect oncogenic HPV in a calendar year}}$$

Numerator is a subset of the denominator

Count is of participants

### Specifications:

#### Numerator specifications

Indicator 8 LBC test in self-collection participants positive for oncogenic HPV (not 16/18)

**Definition:**

Percentage of participants aged 25–74 who have an LBC test after a self-collected screening HPV test positive for oncogenic HPV (not 16/18) in a calendar year.

**Rationale:**

Participants who self-collect their screening test and test positive for oncogenic HPV (not 16/18) are recommended to have a practitioner-collected sample within 6 weeks so that an LBC test can be performed. This indicator monitors compliance with this recommendation within 3 months, and within 6 months, by which time it is considered that most participants would have been able to attend an appointment with a practitioner.

**Calculation:**

**Within 3 months**

$$\frac{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV (not 16/18) in a calendar year who have an LBC test within 3 months} \times 100}{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV (not 16/18) in a calendar year}}$$

**Within 6 months**

$$\frac{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV (not 16/18) in a calendar year who have an LBC test within 6 months} \times 100}{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV (not 16/18) in a calendar year}}$$

Numerator is a subset of the denominator

Count is of participants

## Specifications:

### Numerator specifications

### Comments:

This performance indicator is affected by the change in eligibility requirements for self-collection.

*From 1 July 2022*

Eligibility requirements that had previously restricted self-collection to participants aged 30–74 who had never screened or who were 2 or more years overdue for screening were removed. All participants are now eligible to self-collect their sample.

## Indicator 9 Colposcopy in self-collection participants positive for oncogenic HPV 16/18

### Definition:

Percentage of participants aged 25–74 who have a colposcopy after a self-collected screening HPV test positive for oncogenic HPV 16/18 in a calendar year.

### Rationale:

Participants who self-collect and who test positive for oncogenic HPV 16/18 are recommended to have a colposcopy within 8 weeks. This indicator monitors compliance with this recommendation within 3 months, and within 6 months, by which time it is considered that most participants would have been able to attend an appointment with a colposcopist.

### Calculation:

#### Within 3 months

$$\frac{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV 16/18 in a calendar year who have a colposcopy within 3 months} \times 100}{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV 16/18 in a calendar year}}$$

#### Within 6 months

$$\frac{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV 16/18 in a calendar year who have a colposcopy within 6 months} \times 100}{\text{Number of participants aged 25–74 who self-collect their primary screening HPV test and test positive for oncogenic HPV 16/18 in a calendar year}}$$

Numerator is a subset of the denominator

Count is of participants

## Specifications:

<i>Data items</i>	A1 Participant identifier B4 Date of birth G1 Type of test = V <i>HPV test</i> H1 HPV test date H2 HPV test collection method = A2 <i>Self-collected sample</i> H4 Reason for HPV test = C1 <i>Primary screening HPV test</i> H5 HPV test result – oncogenic HPV = D1 <i>HPV 16/18 detected</i> or D1i <i>Type 16 detected</i> or D1ii <i>Type 18 detected</i> or D1iii <i>Type 18/45 detected</i>

### Comments:

This performance indicator is affected by the change in eligibility requirements for self-collection.

*From 1 July 2022*

Eligibility requirements that had previously restricted self-collection to participants aged 30–74 who had never screened or who were 2 or more years overdue for screening were removed. All participants are now eligible to self-collect their sample.

Indicator 10 Adherence to recommendation for follow-up

**Definition:**

(a) Percentage of participants aged 25–74 who have an intermediate risk screening episode in a calendar year who have a follow-up HPV test between 9 and 15 months.

(b) Percentage of participants aged 25–74 who have an intermediate risk follow-up episode in a calendar year who have a follow-up HPV test between 9 and 15 months.

**Rationale:**

Participants who test positive for oncogenic HPV (not 16/18) and have a negative or pLSIL/ LSIL reflex LBC test result are considered to be of intermediate risk for this primary screening episode, and are recommended to have a follow-up HPV test in 12 months. This indicator monitors compliance with this recommendation for a participant’s first follow-up HPV test 12 months after their intermediate risk primary screening episode (allowing 3 months either side of the recommended 12 months).

Participants who test positive for oncogenic HPV (not 16/18) and have a negative or pLSIL/ LSIL reflex LBC test result at their first follow-up HPV test are considered to be of intermediate risk for this first follow-up episode, and are recommended to have a second follow-up HPV test in another 12 months. This indicator also monitors compliance with the recommendation for a participant’s second follow-up HPV test 12 months after their intermediate risk follow-up episode (again allowing 3 months either side of the recommended 12 months).

**Calculation:**

**First follow-up HPV test after intermediate risk primary screening episode**

$$\frac{\text{Number of participants aged 25– 74 who are determined to be of intermediate risk as the result of a primary screening episode and who are recommended to have a follow- up HPV test in a calendar year who have a follow- up HPV test between 9 and 15 months} \times 100}{\text{Number of participants aged 25– 74 who are determined to be of intermediate risk as the result of a primary screening episode and who are recommended to have a follow- up HPV test in a calendar year}}$$

**Second follow-up HPV test after intermediate risk follow-up episode**

$$\frac{\text{Number of participants aged 25– 74 who are determined to be of intermediate risk as the result of a follow- up episode and who are recommended to have a follow- up HPV test in a calendar year who have a follow- up HPV test between 9 and 15 months} \times 100}{\text{Number of participants aged 25– 74 who are determined to be of intermediate risk as the result of a follow- up episode and who are recommended to have a follow- up HPV test in a calendar year}}$$

Numerator is a subset of the denominator  
Count is of participants

## Specifications:

### Numerator specifications

<i>Definition</i>	Number of participants aged 25–74 who are determined to be of intermediate risk as the result of a screening or follow-up episode in a calendar year who have a follow-up HPV test between 9 and 15 months
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier G1 Type of test = V HPV test H1 HPV test date H4 Reason for HPV test = C2 Follow-up HPV test J2 Primary screening episode completion date J8 First follow-up episode completion date

### Denominator specifications

<i>Definition</i>	Number of participants aged 25–74 who are determined to be of intermediate risk as the result of a screening or follow-up episode in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth J1 Primary screening episode commencement date J2 Primary screening episode completion date J4 Primary screening episode test risk of significant cervical abnormality = R2 Intermediate risk J6 Primary screening episode recommendation = M3 Repeat HPV test in 12 months J7 First follow-up episode commencement date J8 First follow-up episode completion date J10 First follow-up episode test risk of significant cervical abnormality = R2 Intermediate risk J12 First follow-up episode recommendation = M3 Repeat HPV test in 12 months

### Comments:

This performance indicator is affected by the change in the screening policy for participants at *Intermediate risk*.

*From 1 February 2021*

For *Intermediate risk* participants, if HPV (not 16/18) is detected and LBC is negative, pLSIL or LSIL in the follow-up HPV test at 12 months, they will continue to be managed as *Intermediate risk* and recommended to undertake a second HPV follow-up test at 12 months (unless the participant is 2 or more years overdue for screening at the time of the initial screen, identifies as Aboriginal and/or Torres Strait Islander, or is aged 50 years or older, in which case any HPV detected in the follow-up HPV test at 12 months indicates they are *Higher risk* and should be referred to colposcopy).

## Indicator 11 Follow-up results

### Definition:

Percentage of follow-up episodes in participants aged 25–74 in each risk category in a calendar year.

### Rationale:

Follow-up results are the follow-up HPV test result and reflex LBC (where indicated) that occur 12 months after an intermediate risk screening episode result, or 12 months after an intermediate risk follow-up episode result. Distribution of follow-up episode results is a key measure for the screening program and any changes in these distributions over time will require investigation within the broader context of the screening program. For this reason, follow-up results are based on test risk, not participant risk. This indicator is reported separately for first follow-up episodes and second follow-up episodes.

### Calculation:

#### First follow-up episode results

##### Unsatisfactory

$$\frac{\text{Number of first follow-up episodes that were unsatisfactory in participants aged 25–74 in a calendar year} \times 100}{\text{Number of first follow-up episodes in participants aged 25–74 in a calendar year}}$$

##### Low risk

$$\frac{\text{Number of first follow-up episodes that were low risk in participants aged 25–74 in a calendar year} \times 100}{\text{Number of first follow-up episodes in participants aged 25–74}}$$

##### Intermediate risk

$$\frac{\text{Number of first follow-up episodes that were intermediate risk in participants aged 25–74 in a calendar year} \times 100}{\text{Number of first follow-up episodes in participants aged 25–74 in a calendar year}}$$

##### Higher risk

$$\frac{\text{Number of first follow-up episodes that were higher risk in participants aged 25–74 in a calendar year} \times 100}{\text{Number of first follow-up episodes in participants aged 25–74 in a calendar year}}$$

**Second follow-up episode results**

**Unsatisfactory**

$$\frac{\text{Number of second follow-up episodes that were unsatisfactory in participants aged 25-74 in a calendar year} \times 100}{\text{Number of second follow-up episodes in participants aged 25-74 in a calendar year}}$$

**Low risk**

$$\frac{\text{Number of second follow-up episodes that were low risk in participants aged 25-74 in a calendar year} \times 100}{\text{Number of second follow-up episodes in participants aged 25-74}}$$

**Higher risk**

$$\frac{\text{Number of second follow-up episodes that were higher risk in participants aged 25-74 in a calendar year} \times 100}{\text{Number of second follow-up episodes in participants aged 25-74 in a calendar year}}$$

Count is of follow-up episodes

## Specifications:

### Numerator specifications

---

### Comments:

This performance indicator is affected by the change in the screening policy for participants at *Intermediate risk*.

*From 1 February 2021*

For *Intermediate risk* participants, if HPV (not 16/18) is detected and LBC is negative, pLSIL or LSIL in the follow-up HPV test at 12 months, they will continue to be managed as *Intermediate risk* and recommended to undertake a second HPV follow-up test at 12 months (unless the participant is 2 or more years overdue for screening at the time of the initial screen, identifies as Aboriginal and/or Torres Strait Islander, or is aged 50 years or older, in which case any HPV detected in the follow-up HPV test at 12 months indicates they are *Higher risk* and should be referred to colposcopy).

## Indicator 12 Colposcopy rate

### Definition:

Percentage of participants aged 25–74 who have a screening or follow-up episode result that places them at higher risk of significant cervical abnormality in a calendar year who attend colposcopy within 3 months.

### Rationale:

The success of a screening program is reliant on assessment being performed when required. This measures compliance with referral for colposcopy based on a screening episode result or follow-up episode result that places them at higher risk of significant cervical abnormality, and should be calculated for each screening episode result and follow-up episode result.

### Calculation:

#### Oncogenic HPV 16/18 detected + any reflex LBC result

Number of participants aged 25– 74 with a primary screening HPV test in which oncogenic HPV 16/18 is detected in a calendar year who had a colposcopy within 3 months × 100

Number of participants aged 25– 74 with a primary screening HPV test in which oncogenic HPV 16/18 is detected in a calendar year

#### Oncogenic HPV (not 16/18) detected + reflex LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality

Number of participants aged 25– 74 with a primary screening HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality in a calendar year who had a colposcopy within 3 months × 100

Number of participants aged 25– 74 with a primary screening HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality in a calendar year

#### First follow-up episode result that indicates higher risk

Number of participants aged 25– 74 with a first follow- up HPV test in which oncogenic HPV 16/18 is detected or a follow- up HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality or a follow- up HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of negative/pLSIL/LSIL and who were 2 or more years overdue for screening at the time of their initial screen, is Aboriginal and/or Torres Strait Islander, or is aged 50 years or older in a calendar year who had a colposcopy within 3 months × 100

Number of participants aged 25– 74 with a first follow- up HPV test in which oncogenic HPV 16/18 is detected or a follow- up HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality or a follow- up HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of negative/pLSIL/LSIL and who were 2 or more years overdue for screening at the time of their initial screen, is Aboriginal and/or Torres Strait Islander, or is aged 50 years or older in a calendar year

#### Second follow-up episode result that indicates higher risk

Number of participants aged 25– 74 with a second follow- up HPV test in which any oncogenic HPV is detected in a calendar year who had a colposcopy within 3 months × 100

Number of participants aged 25– 74 with a second follow- up HPV test in which any oncogenic HPV is detected in a calendar year

The numerator is a subset of the denominator

Count is of participants

## Specifications:

### Numerator specifications

<i>Definition</i>	Number of participants who had a colposcopy after each specified screening or follow-up episode result within 3 months
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier G1 Type of test K1 Date of colposcopy episode

### Denominator specifications

<i>Definition</i>	Number of participants aged 25–74 who have a screening or follow-up episode result that places them at higher risk of significant cervical abnormality in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth J2 Primary screening episode completion date J3 Primary screening episode result J4 Primary screening episode test risk of significant cervical abnormality J6 Primary screening episode recommendation = M6 Refer for colposcopic assessment J8 First follow-up episode completion date J9 First follow-up episode result J10 First follow-up episode test risk of significant cervical abnormality J12 First follow-up episode recommendation = M6 Refer for colposcopic assessment J14 Second follow-up episode completion date J15 Second follow-up episode result J16 Second follow-up episode test risk of significant cervical abnormality

### Comments:

This performance indicator is affected by the change in the screening policy for participants at *Intermediate risk*.

*From 1 February 2021*

For *Intermediate risk* participants, if HPV (not 16/18) is detected and LBC is negative, pLSIL or LSIL in the follow-up HPV test at 12 months, they will continue to be managed as *Intermediate risk* and recommended to undertake a second HPV follow-up test at 12 months (unless the participant is 2 or more years overdue for screening at the time of the initial screen, identifies as Aboriginal and/or Torres Strait Islander, or is aged 50 years or older, in which case any HPV detected in the follow-up HPV test at 12 months indicates they are *Higher risk* and should be referred to colposcopy).

## Indicator 13 Time to colposcopy

### Definition:

Participants aged 25–74 who have a screening or follow-up episode result that places them at higher risk of significant cervical abnormality, the time between the screening or follow-up result and colposcopy, measured as median and 90th percentile values, as well as within specified timeframes.

### Rationale:

Participants who receive a screening episode result or follow-up episode result that places them at higher risk of significant cervical abnormality will be referred to colposcopy. The recommended timeframes in which they should undergo colposcopic assessment is as per the NCSP Guidelines (Cancer Council Australia and Cervical Cancer Screening Guidelines Working Party). Monitoring actual time between screening result or follow-up result and colposcopy provides important information as to whether participants are receiving timely assessment, as delay in assessment may lead to poorer outcomes.

### Calculation:

#### **Oncogenic HPV 16/18 detected + any reflex LBC result**

For participants aged 25–74 with a screening HPV test in which oncogenic HPV 16/18 is detected in a calendar year who had a colposcopy within 365 days, time to colposcopy in number of days

#### **Oncogenic HPV detected (not 16/18) + reflex LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality**

For participants aged 25–74 with a screening HPV test in which oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality in a calendar year who had a colposcopy within 365 days, time to colposcopy in number of days

#### **First follow-up episode result that indicates higher risk**

For participants aged 25–74 with a first follow-up HPV test in which oncogenic HPV 16/18 is detected or oncogenic HPV (not 16/18) is detected and who had an LBC result of pHSIL/HSIL/cervical cancer/any glandular abnormality or HPV (not 16/18) is detected and who had an LBC result of negative/pLSIL/LSIL and who were 2 or more years overdue for screening at the time of their initial screen, is Aboriginal and/or Torres Strait Islander, or is aged 50 years or older in a calendar year who had a colposcopy within 365 days, time to colposcopy in number of days

#### **Second follow-up HPV episode result that indicates higher risk**

For participants aged 25–74 with a second follow-up HPV test in which any oncogenic HPV is detected in a calendar year who had a colposcopy within 365 days, time to colposcopy in number of days

Count is of days

## Specifications:

### Specifications

<i>Definition</i>	For participants who had a colposcopy within 365 days of a screening or follow-up episode result that places them at higher risk of significant cervical abnormality, the number of days to colposcopy

### Comments:

This performance indicator is affected by the change in the screening policy for participants at *Intermediate risk*.

*From 1 February 2021*

For *Intermediate risk* participants, if HPV (not 16/18) is detected and LBC is negative, pLSIL or LSIL in the follow-up HPV test at 12 months, they will continue to be managed as *Intermediate risk* and recommended to undertake a second HPV follow-up test at 12 months (unless the participant is 2 or more years overdue for screening at the time of the initial screen, identifies as Aboriginal and/or Torres Strait Islander, or is aged 50 years or older, in which case any HPV detected in the follow-up HPV test at 12 months indicates they are *Higher risk* and should be referred to colposcopy).

## Indicator 14 Biopsy rate

### Definition:

Percentage of colposcopies in participants aged 25–74 in which a biopsy was performed in a calendar year.

### Rationale:

Although there are reasons why a biopsy would not be performed at colposcopy, a lower than expected biopsy rate would require further investigation.

### Calculation:

$$\frac{\text{Number of colposcopy episodes at which a biopsy was performed in participants aged 25– 74 in a calendar year}}{\text{Number of colposcopy episodes in participants aged 25– 74 in a calendar year}} \times 100$$

Numerator is a subset of the denominator

Count is of colposcopy episodes

### Specifications:

#### Numerator specifications

<i>Definition</i>	Number of colposcopy episodes at which a biopsy was performed in participants aged 25–74 in a calendar year

## Indicator 15 Yield of high-grade abnormalities on biopsy among participants who attend colposcopy after higher risk screening results

### Definition:

Percentage of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopy in a calendar year who were diagnosed with a high-grade abnormality or cervical cancer on histology within 6 months of colposcopy.

### Rationale:

As participants who are referred to colposcopy are at higher risk of significant cervical abnormality, it is expected that a proportion of these will be diagnosed with a high-grade abnormality or cervical cancer. This indicator can be used as a measure of the accuracy of colposcopy in identifying and sampling a high-grade abnormality or cervical cancer that is present.

### Calculation:

Number of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopy in a calendar year who were diagnosed with a high-grade abnormality or cervical cancer on histology within 6 months of colposcopy × 100

Number of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopy in a calendar year

The numerator is a subset of the denominator

Count is of participants

## Specifications:

### Numerator specifications

---

<i>Definition</i>	Number of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopy in a calendar year who were diagnosed with a high-grade abnormality or cervical cancer on histology within 6 months of colposcopy
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier K1 Date of colposcopy episode L1 Histology test date L7 Histology test result

### Denominator specifications

---

<i>Definition</i>	Number of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopy in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth J2 Primary screening episode completion date J3 Primary screening episode result J4 Primary screening episode test risk of significant cervical abnormality J6 Primary screening episode recommendation = M6 Refer for colposcopic assessment J8 First follow-up episode completion date J9 First follow-up episode result J10 First follow-up episode test risk of significant cervical abnormality J12 First follow-up episode recommendation = M6 Refer for colposcopic assessment J14 Second follow-up episode completion date J15 Second follow-up episode result J16 Second follow-up episode test risk of significant cervical abnormality K1 Date of colposcopy episode

## Indicator 16 Positive predictive value of colposcopy

### Definition:

Percentage of participants aged 25–74 with a higher risk screening or follow-up episode result who had a colposcopic impression of HSIL, glandular abnormality (adenocarcinoma-in-situ) or cancer in a calendar year who were diagnosed with a high-grade abnormality or cervical cancer on histology within 6 months of colposcopy.

### Rationale:

This indicator correlates the colposcopic impression with histological findings to determine the predictive value of colposcopy for high-grade cervical abnormalities. This is an important measure of the quality of colposcopy.

### Calculation:

Number of participants aged 25– 74 with a higher risk screening or follow- up episode result who had a colposcopic impression of HSIL, glandular abnormality (adenocarcinoma- in- situ), or cancer in a calendar year who were diagnosed with a high- grade abnormality or cervical cancer on histology within 6 months of colposcopy

$$\times 100$$

Number of participants aged 25– 74 with a higher risk screening or follow- up episode result who had a colposcopic impression of HSIL, glandular abnormality (adenocarcinoma- in- situ), or cancer in a calendar year

The numerator is a subset of the denominator

Count is of participants

## Specifications:

Indicator 17a High-grade cervical abnormality detection rate

**Definition:**

Number of participants aged 25–74 with a high-grade abnormality detected on histology in a calendar year per 1,000 participants screened.

**Rationale:**

The detection of high-grade abnormalities is an indicator of program performance. High-grade abnormalities have a greater probability of progressing to invasive cancer than do low-grade lesions. Detection of high-grade abnormalities provides an opportunity for treatment before cancer can develop, thus the NCSP aims to detect high-grade abnormalities in line with its broader aim to reduce the incidence of cervical cancer.

**Calculation:**

$$\frac{\text{Number of participants aged 25–74 with a high-grade abnormality detected on histology in a calendar year} \times 1,000}{\text{Number of participants aged 25–74 who had at least one HPV test or cytology test for any reason in a calendar year}}$$

Count is of participants

**Specifications:**

Numerator specifications

<i>Definition</i>	Number of participants aged 25–74 with a high-grade abnormality detected on histology in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth G1 Type of test = H <i>Histology</i> L1 Histology test date L4 Squamous histology cell analysis L5 Endocervical (glandular) histology cell analysis

Denominator specifications

<i>Definition</i>	Number of participants aged 25–74 who had at least one HPV test or cytology test for any reason in a calendar year.
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier B4 Date of birth G1 Type of test = V <i>HPV test</i> or C <i>Cytology test</i> H1 HPV test date I1 Cytology test date

## Indicator 17b Cervical cancer detection rate

### Definition:

Number of participants aged 25–74 with cervical carcinoma detected on histology in a calendar year per 1,000 participants screened.

### Rationale:

The cancer detection rate will be measured alongside the high-grade detection rate.

### Calculation:

$$\frac{\text{Number of participants aged 25–74 with a cervical carcinoma detected on histology in a calendar year} \times 1,000}{\text{Number of participants aged 25–74 who had at least one HPV test or cytology test for any reason in a calendar year}}$$

Count is of participants

### Specifications:

#### Numerator specifications

<i>Definition</i>	Number of participants aged 25–74 with a cervical cancer detected on histology in a calendar year
<i>Source</i>	National Cancer Screening Register
<i>Data items</i>	A1 Participant identifier
	B4 Date of birth
	G1 Type of test = H <i>Histology test</i>

<i>Data items</i>	A1 Participant identifier
	B4 Date of birth
	G1 Type of test = V <i>HPV test</i> or C <i>Cytology test</i>
	H1 HPV test date
	I1 Cytology test date

Indicator 18 Cervical cancers diagnosed by time since last screen

**Definition:**

Number of females aged 25–74 diagnosed with cervical carcinoma in a calendar year categorised into never screened, lapsed screening, and recently screened based on time since last screen.

**Rationale:**

This is a measure of the burden of disease from a lack of participation in the screening program. Time since last screen is used to categorise all females diagnosed with cervical carcinoma as never screened, lapsed screening, or recently screened. Most cervical carcinomas have historically been diagnosed in those who have never screened, which is evidence of the benefit of participation in cervical screening.

Only cervical carcinomas (cervical cancers of epithelial origin) are included, as cervical cancers not of epithelial origin are not expected to be detected through cervical screening.

Never screened is defined as no record of having had a screening test in Australia prior to cancer diagnosis.

Lapsed screening is defined as last screening test >5.5 and ≤7.5 years, >7.5 and ≤10 years or >10 years prior to cancer diagnosis.

Recently screened is defined as last screening test ≤5.5 years prior to cancer diagnosis.

**Calculation:**

**Never screened**

Females aged 25–74 diagnosed with cervical carcinoma in a calendar year who are either on a register with no record of a screening test or not on a register

**Lapsed screening**

Females aged 25–74 diagnosed with cervical carcinoma in a calendar year whose last screening test was >5.5 years and ≤7.5 years before the cervical cancer diagnosis date

Females aged 25–74 diagnosed with cervical carcinoma in a calendar year whose last screening test was >7.5 years and ≤10 years before the cervical cancer diagnosis date

Females aged 25–74 diagnosed with cervical carcinoma in a calendar year whose last screening test was >10 years before the cervical cancer diagnosis date

**Recently screened**

Females aged 25–74 diagnosed with cervical carcinoma in a calendar year whose last screening test was ≤5.5 years before the cervical cancer diagnosis date

## Indicator 19 Incidence of cervical cancer

### Definition:

Number of new cases of cervical cancer in females aged 25–74 in a calendar year per 100,000 estimated resident population.

### Rationale:

Incidence data provide contextual information about the number of new cases of cervical cancer in the population that is an indicator of program performance against its aim to reduce cervical cancer through organised screening.

### Calculation:

$$\frac{\text{Number of new cases of cervical cancer diagnosed in females aged 25–74 in a calendar year} \times 100,000}{\text{Estimated resident population for females aged 25–74 in a calendar year}}$$

Count is of new cases

### Specifications:

## Indicator 20 Mortality from cervical cancer

### Definition:

Number of deaths from cervical cancer in females aged 25–74 in a calendar year per 100,000 estimated resident population.

### Rationale:

Mortality data provide contextual information about the number of deaths from cervical cancer in the population that is an indicator of program performance against its aim to reduce mortality from cervical cancer through organised screening.

### Calculation:

$$\frac{\text{Number of deaths from cervical cancer in females aged 25–74 in a calendar year} \times 100,000}{\text{Estimated resident population for females aged 25–74 in a calendar year}}$$

Count is of deaths

# Acknowledgments

The *National Cervical Screening Program Data Dictionary version 1.2* was prepared by the Screening Analysis and Monitoring Unit of the Australian Institute of Health and Welfare (AIHW), with assistance from state and territory cervical screening programs, the National Cervical Screening Program (NCSP) data dictionary working group, and from cervical screening experts on behalf of the NCSP.

The NCSP data dictionary working group was comprised of the following state and territory cervical screening program representatives.

National Cervical Screening Program data dictionary working group contributing members	
<b>New South Wales</b> Victor Kapruziak	<b>Victoria</b> Professor Marion Saville Ting Zhou
<b>Queensland</b> Nick Ormiston-Smith	<b>Western Australia</b> Nerida Steel Robert Henderson Duane Pearce
<b>Tasmania</b> Carol Ramsey	<b>Australian Institute of Health and Welfare</b> Alison Budd

Thanks are extended to all these individuals for their assistance.

Additional input into specific elements of the data dictionary was provided by the NCSP Quality and Safety Monitoring Committee, the Colposcopy Working Group convened to progress the collection and reporting of colposcopy data in the new NCSP, and cervical screening experts Professor Ian Hammond, Professor Marion Saville, Professor Julia Brotherton, Professor David Roder and Professor Dorota Gertig.

Thanks are extended to all these individuals for their assistance.

The financial support and professional assistance of the Cervical Screening Section, Cancer Policy and Services Branch of the Cancer, Hearing and Program Support Division of the Australian Government Department of Health and Aged Care is also gratefully acknowledged.

The National Cervical Screening Program aims to reduce incidence, morbidity and mortality from cervical cancer in Australia. The National Cervical Screening Program data dictionary is a key document that has been developed by the Australian Institute of Health and Welfare with the assistance of state and territory cervical screening programs and other cervical screening experts to support monitoring and reporting by the Australian Institute of Health and Welfare for the renewed National Cervical Screening Program.
