<b>List of tables.....</b>	<b>v</b>
<b>List of figures.....</b>	<b>xvi</b>
<b>Preface .....</b>	<b>xvii</b>
<b>1. Introduction</b>	
1.1 The Hospital Utilisation and Cost Study 1989–90 .....	1
1.2 Hospital morbidity data .....	1
1.3 Data quality and comparability issues .....	2
1.4 Scope of the report .....	3
1.5 Data requested for HUCS 1989–90 .....	3
1.6 Definitions .....	4
Inpatient .....	4
Separation .....	4
Same day separation .....	5
Bed-days .....	5
Average length of stay .....	5
Age .....	5
Principal diagnosis .....	6
External cause .....	6
Principal procedure .....	6
Secondary surgical .....	6
Hospital type .....	6
Patient charge status .....	6
Year of collection .....	7
1.7 References.....	7
<b>2. Results</b>	
2.1 Introductory notes .....	8
2.2 Hospitalisation rates in Australia during 1989–90 .....	8
2.3 Inter-sectorial differences .....	10
<b>Appendices</b>	
A. Sex by age tables .....	23
B. Diagnosis tables .....	62
C. Procedure tables .....	151
D. External cause tables .....	240
E. Population estimates used .....	285
F. State specific details, definitions and policy statements .....	286

Table 1:	Comparison of HUCS 1989–90 Volume 1 and Volume 2, results for acute hospitals, Australia.....	9
----------	---	---

## Sex by age tables

### Separations

Table 1.1:	Number of separations from public acute hospitals by sex, age, State and Territory .....	24
Table 1.2:	Number of separations from private acute hospitals by sex, age, State and Territory .....	25
Table 1.3:	Number of separations from repatriation hospitals by sex, age, State and Territory, 1989–90.....	26
Table 1.4:	Number of separations from acute hospitals by sex, age, State and Territory.....	27

### Occupied bed-days

Table 1.5:	Occupied bed-days in public acute hospitals by sex, age, State and Territory .....	28
Table 1.6:	Occupied bed-days in private acute hospitals by sex, age, State and Territory.....	29
Table 1.7:	Occupied bed-days in repatriation hospitals by sex, age, State and Territory, 1989–90.....	30
Table 1.8:	Occupied bed-days in acute hospitals by sex, age, State and Territory.....	31

### Separations per 1,000 population

Table 1.9:	Separations from public acute hospitals per 1,000 population by sex, age, State and Territory.....	32
Table 1.10:	Separations from private acute hospitals per 1,000 population by sex, age, State and Territory.....	33
Table 1.11:	Separations from repatriation hospitals per 1,000 population by sex, age, State and Territory, 1989–90.....	34
Table 1.12:	Separations from acute hospitals per 1,000 population by sex, age, State and Territory.....	35

### Occupied bed-days per 1,000 population

Table 1.13:	Occupied bed-days in public acute hospitals per 1,000 population by sex, age, State and Territory .....	36
Table 1.14:	Occupied bed-days in private acute hospitals per 1,000 population by sex, age, State and Territory .....	37
Table 1.15:	Occupied bed-days in repatriation hospitals per 1,000 population by sex, age, State and Territory, 1989–90 .....	38

Table 1.16: Occupied bed-days in acute hospitals per 1,000 population by sex, age, State and Territory.....	39
<b>Average length of stay</b>	
Table 1.17: Average length of stay in public acute hospitals by sex, age, State and Territory.....	40
Table 1.18: Average length of stay in private acute hospitals by sex, age, State and Territory.....	41
Table 1.19: Average length of stay in repatriation hospitals by sex, age, State and Territory, 1989–90.....	42
Table 1.20: Average length of stay in acute hospitals by sex, age, State and Territory .	43
<b>Same day separations</b>	
Table 1.21: Percentage of same day separations from public acute hospitals by sex, age, State and Territory .....	44
Table 1.22: Percentage of same day separations from private acute hospitals by sex, age, State and Territory .....	45
Table 1.23: Percentage of same day separations from repatriation hospitals by sex, age, State and Territory, 1989–90 .....	46
Table 1.24: Percentage of same day separations from acute hospitals by sex, age, State and Territory.....	47
<b>Patients in public acute hospitals</b>	
Table 1.25: Percentage of public patients in public acute hospitals by sex, age, State and Territory .....	48
Table 1.26: Percentage of private patients in public acute hospitals by sex, age, State and Territory .....	49
Table 1.27: Percentage of other patients in public acute hospitals by sex, age, State and Territory .....	50
<b>Bed-days occupied in public acute hospitals</b>	
Table 1.28: Percentage of bed-days occupied by public patients in public acute hospitals by sex, age, State and Territory .....	51
Table 1.29: Percentage of bed-days occupied by private patients in public acute hospitals by sex, age, State and Territory .....	52
Table 1.30: Percentage of bed-days occupied by other patients in public acute hospitals by sex, age, State and Territory .....	53
<b>Patients in public and private acute hospitals</b>	
Table 1.31: Percentage of public patients in public and private acute hospitals by sex, age, State and Territory .....	54
Table 1.32: Percentage of private patients in public and private acute hospitals by sex, age, State and Territory .....	55
Table 1.33: Percentage of other patients in public and private acute hospitals by sex, age, State and Territory .....	56

### **Bed-days occupied in public and private acute hospitals**

Table 1.34: Percentage of bed-days occupied by public patients in public and private acute hospitals by sex, age, State and Territory.....	57
Table 1.35: Percentage of bed-days occupied by private patients in public and private acute hospitals by sex, age, State and Territory.....	58
Table 1.36: Percentage of bed-days occupied by other patients in public and private acute hospitals by sex, age, State and Territory.....	59

### **Other patients in private acute hospitals**

Table 1.37: Percentage of other patients in private acute hospitals by sex, age, State and Territory.....	60
Table 1.38: Percentage of bed-days occupied by other patients in private acute hospitals by sex, age, State and Territory .....	61

### **Diagnosis tables**

#### **Separations from public acute hospitals by principal diagnoses**

Table 2.1: Separations of male patients from public acute hospitals per 1,000 male population by principal diagnoses, State and Territory.....	63
Table 2.2: Separations of female patients from public acute hospitals per 1,000 female population by principal diagnoses, State and Territory.....	65
Table 2.3: Separations from public acute hospitals per 1,000 population by principal diagnoses, State and Territory .....	67

#### **Separations from private acute hospitals by principal diagnoses**

Table 2.4: Separations of male patients from private acute hospitals per 1,000 male population by principal diagnoses, State and Territory.....	69
Table 2.5: Separations of female patients from private acute hospitals per 1,000 female population by principal diagnoses, State and Territory.....	71
Table 2.6: Separations from private acute hospitals per 1,000 population by principal diagnoses, State and Territory .....	73

#### **Separations from repatriation hospitals by principal diagnoses**

Table 2.7: Separations of male patients from repatriation hospitals per 1,000 male population by principal diagnoses, State and Territory, 1989–90 .....	75
Table 2.8: Separations of female patients from repatriation hospitals per 1,000 female population by principal diagnoses, State and Territory, 1989–90... ..	77
Table 2.9: Separations from repatriation hospitals per 1,000 population by principal diagnoses, State and Territory, 1989–90 .....	79

#### **Separations from acute hospitals by principal diagnoses**

Table 2.10: Separations of male patients from acute hospitals per 1,000 male population by principal diagnoses, State and Territory .....	81
Table 2.11: Separations of female patients from acute hospitals per 1,000 female population by principal diagnoses, State and Territory .....	83

Table 2.12: Separations of patients from acute hospitals per 1,000 population by principal diagnoses, State and Territory .....	85
<b>Bed-days occupied in public acute hospitals by principal diagnoses</b>	
Table 2.13: Bed-days occupied by male patients in public acute hospitals per 1,000 male population by principal diagnoses, State and Territory.....	87
Table 2.14: Bed-days occupied by female patients in public acute hospitals per 1,000 female population by principal diagnoses, State and Territory.....	89
Table 2.15: Bed-days occupied in public acute hospitals per 1,000 population by principal diagnoses, State and Territory .....	91
<b>Bed-days occupied in private acute hospitals by principal diagnoses</b>	
Table 2.16: Bed-days occupied by male patients in private acute hospitals per 1,000 male population by principal diagnoses, State and Territories .....	93
Table 2.17: Bed-days occupied by female patients in private acute hospitals per 1,000 female population by principal diagnoses, State and Territories .....	95
Table 2.18: Bed-days occupied in private acute hospitals per 1,000 population by principal diagnoses, State and Territories.....	97
<b>Bed-days occupied in repatriation hospitals by principal diagnoses</b>	
Table 2.19: Bed-days occupied by male patients in repatriation hospitals per 1,000 male population by principal diagnoses, State and Territory, 1989–90.....	99
Table 2.20: Bed-days occupied by female patients in repatriation hospitals per 1,000 female population by principal diagnoses, State and Territory, 1989–90.....	101
Table 2.21: Bed-days occupied by patients in repatriation hospitals per 1,000 population by principal diagnoses, State and Territory, 1989–90 .....	103
<b>Bed-days occupied in acute hospitals by principal diagnoses</b>	
Table 2.22: Bed-days occupied by males in acute hospitals per 1,000 male population by principal diagnoses, State and Territory .....	105
Table 2.23: Bed-days occupied by females in acute hospitals per 1,000 female population by principal diagnoses, State and Territory .....	107
Table 2.24: Bed-days occupied in acute hospitals per 1,000 population by principal diagnoses, State and Territory .....	109
<b>Average length of stay in public acute hospitals by principal diagnoses</b>	
Table 2.25: Average length of stay of male patients in public acute hospitals by principal diagnoses, State and Territory .....	111
Table 2.26: Average length of stay of female patients in public acute hospitals by principal diagnoses, State and Territory .....	113
Table 2.27: Average length of stay in public acute hospitals by principal diagnoses, State and Territory.....	115

### **Average length of stay in private acute hospitals by principal diagnoses**

Table 2.28: Average length of stay of male patients in private acute hospitals by principal diagnoses, State and Territory .....	117
Table 2.29: Average length of stay of female patients in private acute hospitals by principal diagnoses, State and Territory .....	119
Table 2.30: Average length of stay in private acute hospitals by principal diagnoses, State and Territory .....	121

### **Average length of stay in repatriation hospitals by principal diagnoses**

Table 2.31: Average length of stay of male patients in repatriation hospitals by principal diagnoses, State and Territory, 1989–90 .....	123
Table 2.32: Average length of stay of female patients in repatriation hospitals by principal diagnoses, State and Territory, 1989–90 .....	125
Table 2.33: Average length of stay in repatriation hospitals by principal diagnoses, State and Territory, 1989–90.....	127

### **Average length of stay in acute hospitals by principal diagnoses**

Table 2.34: Average length of stay of male patients in acute hospitals by principal diagnoses, State and Territory .....	129
Table 2.35: Average length of stay of female patients in acute hospitals by principal diagnoses, State and Territory .....	131
Table 2.36: Average length of stay in acute hospitals by principal diagnoses, State and Territory .....	133

### **Same day separations by principal diagnoses**

Table 2.37: Percentage of same day separations from public acute hospitals by principal diagnoses, State and Territory .....	135
Table 2.38: Percentage of same day separations from private acute hospitals by principal diagnoses, State and Territory .....	137
Table 2.39: Percentage of same day separations from repatriation hospitals by principal diagnoses, State and Territory, 1989–90 .....	139
Table 2.40: Percentage of same day separations from acute hospitals by principal diagnoses, State and Territory .....	141

### **Public patients in public and private acute hospitals by principal diagnoses**

Table 2.41: Percentage of public patients in public acute hospitals by principal diagnoses, State and Territory .....	143
Table 2.42: Percentage of bed-days occupied by public patients in public acute hospitals by principal diagnoses, State and Territory .....	145
Table 2.43: Percentage of public patients in public and private acute hospitals by principal diagnoses, State and Territory .....	147
Table 2.44: Percentage of bed-days occupied by public patients in public and private acute hospitals by principal diagnoses, State and Territory .....	149

## **Procedure tables**

### **Separations from public acute hospitals by principal procedures**

Table 3.1: Separations of male patients from public acute hospitals per 1,000 male population by principal procedures, State and Territory.....	152
Table 3.2: Separations of female patients from public acute hospitals per 1,000 female population by principal procedures, State and Territory.....	154
Table 3.3: Separations from public acute hospitals per 1,000 population by principal procedures, State and Territory .....	156

### **Separations from private acute hospitals by principal procedures**

Table 3.4: Separations of male patients from private acute hospitals per 1,000 male population by principal procedures, State and Territory.....	158
Table 3.5: Separations of female patients from private acute hospitals per 1,000 female population by principal procedures, State and Territory.....	160
Table 3.6: Separations of patients from private acute hospitals per 1,000 population by principal procedures, State and Territory .....	162

### **Separations from repatriation hospitals by principal procedures**

Table 3.7: Separations of male patients from repatriation hospitals per 1,000 male population by principal procedures, State and Territory, 1989–90 .....	164
Table 3.8: Separations of female patients from repatriation hospitals per 1,000 female population by principal procedures, State and Territory, 1989–90.....	166
Table 3.9: Separations from repatriation hospitals per 1,000 population by principal procedures, State and Territory, 1989–90 .....	168

### **Separations from acute hospitals by principal procedures**

Table 3.10: Separations of male patients from acute hospitals per 1,000 male population by principal procedures, State and Territory .....	170
Table 3.11: Separations of female patients from acute hospitals per 1,000 female population by principal procedures, State and Territory .....	172
Table 3.12: Separations from acute hospitals per 1,000 population by principal procedures, State and Territory .....	174

### **Bed-days occupied in public acute hospitals by principal procedures**

Table 3.13: Bed-days occupied by male patients in public acute hospitals per 1,000 male population by principal procedures, State and Territory.....	176
Table 3.14: Bed-days occupied by female patients in public acute hospitals per 1,000 female population by principal procedures, State and Territory.....	178
Table 3.15: Bed-days occupied in public acute hospitals per 1,000 population by principal procedures, State and Territory .....	180

### **Bed-days occupied in private acute hospitals by principal procedures**

# Preface

---

## Structure of report

*Hospital Utilisation and Costs Study* (HUCS) 1989–90 consists of two volumes:

1. *Survey of public hospitals and related data* by Gillett and Solon. This volume updates institutional data given in Volume 2 of HUCS 1985–86 and HUCS 1987–88. Summary hospital morbidity data are not included in this volume.
2. *The use of acute hospitals—a summary of hospital morbidity* by Gillett, Liu and Solon. This volume summarises information available from hospital discharge abstract databases (hospital morbidity data) for 1989–90, or the closest available year. It greatly extends the data provided in chapter 5 of HUCS 1987–88.

## A note from the authors

While significant gains have been made in the quality, uniformity and coverage of hospital morbidity data in Australia, we recognise that problems remain. The most serious problem is the lack of complete data from all States. Some States provided only sampled data. Other States and Territories could not provide data for private hospitals.

Despite these limitations, most of the information presented here is sufficiently accurate and consistent for the analyses of broad trends and differentials. Tables exclude States and Territories where data are unavailable. Consequently, in this report, some totals do not necessarily represent Australian totals, particularly where private hospitals are involved. In HUCS 1985–86, the authors attempted to estimate Australian totals. In this report, only Australian rates are estimated. This was done by adding the estimated rates for public, private and repatriation hospitals.

## Acknowledgements

We are grateful to the many people who contributed to this report, especially the officers of the Department of Veterans' Affairs and the various State and Territory health authorities who provided us with the data and comments.

# 1 Introduction

---

## 1.1 The Hospital Utilisation and Costs Study 1989–90

In 1990 the Australian Health Ministers' Advisory Council (AHMAC) requested that the Australian Institute of Health and Welfare (AIHW) do a study of hospital use and costs for the year 1989–90. The study was to be similar in scope to those done for the previous Hospital Utilisation and Costs Studies (HUCS 1985–86, Volume 2 and HUCS 1987–88).

The aims of the earlier HUCS surveys were to provide data to help the Commonwealth, States and Territories in planning and funding hospital systems. AIHW collected data on utilisation, costs and staffing levels for hospitals and related institutions; in addition, the various health authorities provided summary information from their hospital morbidity collections (see section 1.2).

This report gives detailed information on the types of patients using acute hospitals. Data have been extracted from the hospital morbidity data collected by the various health authorities. It updates and extends the data provided in HUCS 1985–86, Volume 2, chapter 6, and HUCS 1987–88, chapter 5.

## 1.2 Hospital morbidity data

Hospitals collect information about the patients they treat so that they can provide quality care, from both administrative and clinical perspectives. However, the data are often useful for other purposes such as:

- the planning, delivery and costing of hospital services
- allocation of financial, technological and labourforce requirements
- influencing policy formulation and informing policy debate
- monitoring the effects of policy
- monitoring equity and access to hospital services
- identification of populations at risk
- epidemiological research
- monitoring the effect of illness and accident prevention programs
- market research.

Consequently, the various health authorities often aggregate the patient level data to produce State data collections—a process which routinely involves removing information, except for a patient record number, that identifies the patient. The hospital that cared for the patient can, if necessary, and subject to ethical constraints and patient confidentiality, locate a patient's record using the patient record number. For example, a clinician might wish to examine the case histories of a rare disease before deciding on the best treatment for a patient. In many cases even the patient record numbers are removed.

Most health authorities have collected data about inpatients (admitted patients) for several years. These data are usually referred to as hospital morbidity data. Over recent years, advances in health information systems and the increased use of computers has greatly increased AIHW's ability to collect and interpret large volumes of patient level information. Consequently, the numbers of hospitals providing morbidity data have increased, and the timeliness of the data has improved.

While each health authority collects data for its own purposes, core data items are usually either collected in a comparable format, or are able to be converted into a compatible format. These data items include:

- demographic details including address, date of birth, sex, country of birth and marital status
- payment details including charging category and insurance status
- administrative details such as admission and discharge dates
- clinical details including diagnoses, procedures and the external causes of injuries.

In addition, most health authorities derive a number of useful items of information from the data collected. These include:

- length of stay in hospital
- age
- diagnosis related group (from age, separation mode, diagnoses and procedures)
- geographic area.

### **1.3 Data quality and comparability issues**

The high level of compatibility between the various hospital morbidity databases is in part due to the work done during the 1970s by the National Committee on Health and Vital Statistics (NCHVS), and more recently, the development of the National Minimum Data Set for Institutional Health Care (NMDS), the Casemix Development Program run by the Commonwealth Department of Health, Housing and Community Services (HHCS), and groups such as the Medical Record Association of Australia.

Despite the similarities, the morbidity collections still vary in quality, scope and definition. Also, the reliability of the information varies between data items. Most sociodemographic and administrative data are reasonably reliable; Aboriginal status is the exception, and is often of poor quality.

Clinical data items also vary in reliability. For most diseases the data are reliable; however, rare diseases and diseases or procedures for which new codes have been added to International Classification of Diseases (ICD) are of lower reliability. Codes are introduced on a regular basis to account for new technologies and emerging medical conditions (for example, HIV infection).

Data relating to sensitive social or legal issues are also of lower reliability. For example, it is likely that code 637 'Unspecified abortion' would be used rather than code 636 'Illegally induced abortion'. Also, hospitals have little incentive to report data which reflect poorly on their operation. For example, during the 1980s, New South Wales health authorities attempted to collect details on complications relating to hospitalisation. These included 'adverse effects of antibiotics', 'bed sores' and 'wound infections'. Not surprisingly, hospitals rarely used these fields. New South Wales health authorities no longer request this information.

Information processing differences can make inter-hospital comparisons difficult. Coding practices can vary, especially between States and Territories. For example, a patient admitted for renal dialysis can be coded as V56 'Aftercare involving intermittent dialysis' or as 584 'Acute renal failure' with a procedure code of 39.95 'Hemodialysis'. Also, some medical officers provide less clinical detail in their patients' files than others. As a result, it is often impossible for medical records staff to attach specific codes and most collections have large numbers of patients classified as 'unspecified' and 'other'. Medical officers also vary in the extent to which they record complicating conditions and co-morbidities as secondary diagnoses.

For a few data items, differences in definition can make comparisons difficult. Most States and Territories define the principal diagnosis as the condition that required the most resources for the hospital to treat. South Australian health authorities define the principal diagnosis as the condition that, after study, was responsible for the patient being admitted to hospital. Roberts et al. (1985) found that 6.4% of patients received different principal diagnoses, depending upon the definition used.

Queensland health authorities coded clinical information using the ninth revision of the International Classification of Diseases (ICD-9), while all other health authorities used the clinical modification of ICD-9 (ICD-9-CM). The Queensland data have been mapped into ICD-9-CM for this report.

There are a number of technical problems in using the morbidity data to measure the amount of acute hospital care provided within Australia. These include:

- the treatment of leave days. Many of the morbidity collections do not record the number of days during which a patient is on leave. As a result, calculating the number of occupied bed-days for a given hospital can give different results than would be indicated from ward daily record books. The bed-day numbers will therefore differ between this volume and HUCS 1989–90, Volume 1. The NMDS recommends that the total number of leave days associated with each separation be recorded.
- the collections do not adequately distinguish between patients requiring acute care and those requiring non-acute care. A patient may be admitted to a hospital for an acute condition but not be able to be discharged due to the lack of appropriate nursing facilities. Such extended stays can distort both the usage of some hospitals (especially country hospitals), and data on patients with a specific condition.
- the morbidity collections only include data for inpatients. Some patients can be treated either as same day inpatients or as non-inpatients (ambulatory patients). Hospitals vary in the extent to which they treat these patients as inpatients.
- the structure of the health delivery system. As the morbidity data collections are based upon the numbers of periods of hospital care, and not the numbers of people receiving care, inter-hospital transfers appear as multiple entries in the databases. This means that a health system with high levels of hospital role delineation, that require more inter-hospital transfers, will have more separations per thousand population than other hospital systems.

It is important to note that data entry errors can, and do, occur. Such errors can result in apparent inconsistencies. For example, males being coded as having a principal diagnosis relating to childbirth or disease of the female reproductive organs.

## **1.4 Scope of report**

The health authorities were asked to provide data for all acute public hospitals—as was provided for HUCS 1989–90, Volume 1. A full description of the hospitals involved is given in that report. State and Territory health authorities were asked to provide data for patients separating (see *Separation*, page 4) from private hospitals. Not all authorities were able to supply these data (not supplied by Victoria, Tasmania, Australian Capital Territory and Northern Territory).

## **1.5 Data requested for HUCS 1989–90**

The AIHW requested that each health authority provide summary data from their hospital morbidity collections—the same as for HUCS 1987–88. Some States and Territories had previously provided AIHW with a copy of their data collections. In these cases, AIHW extracted the summary information used in this report.

The various health authorities did not process data from all patients in 1989–90. In New South Wales, rotational sampling was used for some hospitals, resulting in about an 80% sample. For Tasmania, 92% of 1989–90 records had been coded. In these cases, the data have been weighted to give yearly estimates. Further, a minor correction was made to the South Australian data to adjust for a slight under-reporting within their patient level data files. Data for patients admitted to private hospitals were unavailable for Victoria, Tasmania, the Australian Capital Territory and the Northern Territory.

Each authority was asked to provide four data files. These contained the number of separations and occupied bed-days for specified groupings of the following data items:

- patient age
- principal diagnosis
- external cause
- principal and secondary procedure details.

These data were also disaggregated by hospital type, sex, and patient charging status.

## 1.6 Definitions

Definitions specific to individual States, Territories and the Department of Veterans' Affairs are listed in Appendix F; general definitions used throughout this volume are listed below.

### Inpatient

The NMDS considers an 'inpatient' as any patient who is formally admitted to a hospital for the purposes of receiving care. While this is generally accepted in Australia, South Australia regards inpatients as only those patients staying overnight. This is a commonly-used definition in other countries. This report uses the NMDS definition and has included South Australian same day patients as 'inpatients'.

For any given year, inpatient statistics can include details on inpatients who were admitted, separated (see *Separation* below) or treated during the year. Patients usually stay in acute hospitals for six or seven days and the differences between counting patients under the various methods is small but significant, especially when counting bed-days.

Hospital morbidity collections are usually based on patients separating during the year. This has been, at least in part, for data processing convenience. Previously, patient records were only entered into a computer when they were finalised. Discharge date and the principal diagnosis (usual definition) can be determined after separation. Therefore, patient information was only available for analysis after separation. However, with the use of more advanced patient information systems these considerations are less important, and some collections contain details of patients who are in hospital at the year's end.

This report follows the normal convention and describes hospital use in terms of patients separating during 1989–90, or the closest available year.

### Separation

Separation is the process where a patient leaves a hospital. This can be either by discharge, transfer or death. The number of separations refers to the number of periods of hospital care, not the number of people going to hospital in a given year. Some patients have multiple periods of care and are counted multiple times; for example, a hemodialysis patient can be admitted and then discharged every few days.

Each patient stay was counted only once. Separations were not recorded for:

- short period leave;
- newborn babies who experience no morbidity;
- transfers from one ward to another; and
- status change.

As one person can have multiple separations in a year for the same condition, the separation rates per thousand population given in this report often do not indicate either the incidence or prevalence of disease.

The various authorities also have different policies in the treatment of some conditions; for example, renal dialysis can be treated in acute hospitals or through satellite dialysis centres. The inclusion/exclusion of alternative sites of care also affects the numbers of reported inpatients.

### **Same day separation**

This report defines a same day separation as a separation for which the date of separation equals the date of admission.

### **Bed-days**

In this report the number of bed-days per patient was calculated by subtracting the admission date from the separation date. Where the admission date and the separation date were the same, this report uses a length of stay of one day. Where a patient stayed for more than 300 days, only 300 bed-days were counted.

Bed-days were for all patients separating during the year. Leave days were included in the bed-day count. This means that the bed-day numbers given in this report will differ from those given in Volume 1 of HUCS 1989–90. In Volume 1, bed-days referred to days of care during the year.

### **Average length of stay**

This report calculates average length of stay by dividing the total number of bed-days by the number of separations. The average length of stay data given in this report is regarded as more accurate than the estimates provided in HUCS 1989–90, Volume 1.

### **Age**

Age is the age at admission to hospital. Health authorities were asked to provide data using the following age groups:

0 years  
1 to 4 years  
5 to 9 years  
10 to 14 years  
15 to 19 years  
...  
...  
...  
80 to 84 years  
85 + years  
Unknown/Uncoded

Age and sex details were supplied separately to clinical information. Consequently, all separation rates per thousand population are crude rates and have not been adjusted for demographic differences.

## **Principal diagnosis**

For this report the usual Australian definition of principal diagnosis was used; that is, the disease, condition or injury treated which, at the time of separation, best accounts for the stay in hospital. In practice most States have minor variations on this definition. However, South Australian health authorities were unable to provide data using this definition and have provided data on the disease or condition causing the admission.

Principal diagnosis was supplied using the ICD-9-CM diagnosis code at the three digit level; for example, 584 for 'Acute renal failure'.

## **External cause**

External cause describes the cause of the accident for all inpatients admitted for treatment following injury, poisonings and other adverse effects.

This report uses the supplementary classification of External cause of Injury and Poisoning in the ICD-9-CM at the three digit level. (Example: code 'Pedal cycle accident' as E826).

## **Principal procedure**

The principal procedure is the procedure involving the greatest resource use, and most related to the principal diagnosis, performed during the period of hospitalisation. All procedures (including surgical, investigative radiological etc.) were included. Procedures were coded using the first three digits of the ICD-9-CM coding scheme.

## **Secondary surgical**

Refers to procedures other than the principal procedure. Coding and scope are as for the principal procedure.

## **Hospital type**

This volume classifies hospitals as:

- Acute public teaching hospitals
- Acute public metropolitan non-teaching hospitals
- Acute public rural non-teaching hospitals
- Private hospitals
- Department of Veterans' Affairs (Repatriation) hospitals.

Private hospital data were only available for New South Wales, Queensland, Western Australia and South Australia. Where necessary, national rates have been estimated using these data.

After veterans' needs have been met, spare capacity in the repatriation general hospitals is utilised to treat community patients. The number of beds available in repatriation general hospitals for treating community patients is restricted to ensure the ready availability of services to entitled veterans and war widows.

Long stay public psychiatric hospitals are excluded from this report.

## **Patient charge status**

This report classifies patients into the following charging categories:

- Medicare
- Private
- Compensable
- Unknown/Uncoded.

## **Year of collection**

Health authorities were asked to supply data for a single year. The order of preference for the year was:

1. 1989-90 financial year
2. 1989 calendar year
3. last year for which data are available.

Financial years were the preferred option as they most closely relate to the data provided in HUCS 1989-90, Volume 1.

Data were supplied for the following years:

1989-90: New South Wales, Victoria, South Australia, Tasmania and DVA  
1989 : Queensland and Western Australia  
1988-89: Australia Capital Territory  
1988 : Northern Territory.

Australian data for 1989-90 were estimated from these data.

## 2 Results

---

### 2.1 Introductory notes

This chapter describes the use of acute hospitals in Australia during 1989–90, as reported in State and Territory morbidity collections. This contrasts with Volume 1, HUCS 1989–90, which reports hospital activity data derived from administrative systems. The appendixes provide States and Territory-specific information for those readers requiring more detail and inter-State comparisons.

In many cases results are estimated using data from only some States and Territories or data from different years (see Table 1 notes and *Year of collection* on page 7). For this reason, differences occur between the results given in this report and those given in HUCS 1989–90, Volume 1. Of particular importance is the treatment of private hospital separations, bed-days and rates. Morbidity information for private hospitals was only available for New South Wales, Victoria, Western Australia and South Australia, and rates for Australia were estimated using these data. While the reader needs to remember the limitations, the data are sufficient to give an accurate description of hospital use in Australia during 1989–90.<sup>1</sup>

This chapter is divided into two parts which describe:

- illness within the Australian population, as measured by their use of hospitals;
- inter-sectorial differences in hospital use.

### 2.2 Hospitalisation rates in Australia during 1989–90

In 1989–90 there were about 3.8 million separations from acute hospitals, which represented 223 separations per thousand population. People aged 75 years and older were the most likely to use acute hospitals, with an estimated 579 separations per thousand population (Figure 1, page 13). People who were less than one year old were also very likely to use hospitals, with an estimated 477 separations per thousand population. Children who were at least one year old had the lowest hospital use, with only 105 separations per thousand population. The 15 to 34 year cohort showed a slightly increased use, corresponding with women being admitted for childbirth and obstetric reasons. These differences are largely due to differences in the use of public hospitals.

After excluding hospitalisations relating to pregnancy, unadjusted separation rates were similar for males (194 per thousand) and females (200 per thousand). Males were more likely to be admitted to hospital for problems associated with the circulatory system, the respiratory system and for injuries and poisonings than females. Females were more likely to be admitted for problems associated with the genito-urinary systems than males (Figures 2 and 3, pages 14 and 15).

Except for the main childbearing ages (15 to 34 and, to a lesser extent, 35 to 49 years) males were more likely to use acute hospitals than females (Figure 1, page 13).

---

<sup>1</sup> HUCS 1989–90 Volume 1 reported 159 public hospital separations, 59 private hospital separations and 5 repatriation hospital separations per thousand population (Table 4.4). This report suggests 157 public hospital separations, 58 private hospital separations and 5 repatriation hospital separations per thousand population.

- (d) Estimated by adding rates for public, private and repatriation hospitals.
- (e) Private hospital totals and rates were based upon data from NSW, Qld, WA and SA.
- (f) Private hospitals in the Northern Territory were included in South Australia.

Source: HUCS 1989–90, Volume 1 Tables 4.2 to 4.5; Volume 2 Tables 1.1 to 1.16.

The relative ratio<sup>2</sup> (Figure 4, page 16) shows that:

- male children are about 30 per cent more likely to be admitted than female children;
- elderly males are about 40 per cent more likely to be admitted to public hospitals than elderly women; and
- during the childbearing years males are between 30 and 60 per cent less likely to be admitted than females.

Both males and females have similar average lengths of stay<sup>3</sup>, except for the very old and the very young, where females usually have slightly longer stays (Figure 5, page 17). The reasons for these differences are uncertain but could include:

- differences in the types of diseases that result in males and females being admitted to hospitals (see Tables 2.1 to 2.12)
- differences in the types of complications and co-morbidities in males and females. For example, women have longer stays for orthopedics than men, which could be due to higher levels of osteoporosis in elderly women
- differences in the amount of care available to men and women within the community to facilitate early discharge.

Acute hospitals treated about 25% of their patients on a same day basis (Table 1.24). The percentage varied widely between States and Territories (Tables 1.21 to 1.24) and was slightly higher for males (26%) than for females (24%).

### 2.3 Inter-sectorial differences

In 1989–90, around 72 per cent of acute hospital separations were from public acute hospitals, 26 per cent were from private acute hospitals and 2 were from repatriation hospitals (Figure 6, page 18). Patients in public and private hospitals were of similar ages, with the exception that private hospitals had fewer patients under the age of one year and more patients aged 35 to 49 (Figure 7, page 19). Patients using repatriation hospitals were more likely to be male (Appendix A, Table 1.3) and about three-quarters were aged 65 years or more.

There were few significant age/sex differences in charging status, except for males aged 15 to 34 years who were less likely to be treated as a private patient and more likely to be treated as a compensable/uncoded patient (see Tables 1.24, 1.25 and 1.27).

Significant differences existed between States in the proportion of patients treated as public patients in public hospitals (see Table 1.25). The effect of these differences on hospital medical costs is considered in HUCS 1989–90, Volume 1, Chapter 5.

On average, people who are treated in private hospitals have shorter stays than people who are treated in public hospitals. This trend is consistent for all age groups and both sexes. However, for most disease groups the average length of

---

#### 2 Relative ratio

In this case, relative ratio is defined as the likelihood of a male being admitted as compared to a female being admitted expressed as a percentage difference from one.

$$R.R. = 100 \times [(\text{male rate} / \text{female rate}) - 1]$$

where SR is separation rate and RR is relative ratio.

#### 3 Male and female average lengths of stay

The estimated average length of stay for both males and females was about 5.5 days. This figure varied slightly depending upon whether the age/sex database or the diagnoses database was used to estimate private hospital use in those States for which private hospital data were unavailable.

stay was either similar or lower for public hospitals (Tables 2.27 and 2.30). Exceptions included:

- HIV infection;
- diseases of the blood and blood-forming organs;
- central nervous system disorders and diseases;
- hypertensive disease;
- other diseases of the respiratory system.

This suggests that the differences in length of stay between public and private hospitals may largely be due to differences in diseases treated (casemix) rather than in medical practice.

Repatriation hospitals do not show consistent trends in length of stay by age. The 35 to 49 and 50 to 64 year cohorts have longer lengths of stay in repatriation hospitals than in public hospitals. This trend is reversed for the 75 years and over group.

Repatriation hospitals (31%) and private hospitals (27%) treated a higher percentage of patients on a same day basis than did public hospitals (24%) (Tables 1.21 to 1.23). However, this was not consistent for all disease groups. Public hospitals treated a higher proportion of patients on a same day basis for patients with:

- HIV infection;
- other metabolic and immunity disorders; and
- diseases of the oral cavity, salivary glands and jaws.

Further, for all types of hospitals, the proportion varied considerably between disease groups (Table 2.40). The highest rates were for HIV infection (73%), diseases of the esophagus, stomach and duodenum (60%), disease of the ear and mastoid process (47%) and other reasons for contact with health service (66%)<sup>4</sup>.

During 1989–90 public hospitals treated:

- 72% of patients as public patients;
- 25% of patients as private patients; and
- 3% of patients were compensable patients or had an unknown status.

Patients used about 21 million bed-days in 1989–90 (see Table 1, page 9). Three-quarters of these were in public acute hospitals, about one-fifth were in private hospitals and only 3 to 4 per cent in repatriation hospitals (Figure 8, page 20). Age distributions were similar to those for separations (Figure 1, page 13), except that older people used an increased proportion of bed-days, corresponding to their longer stays in hospital. People aged 50 years or more used just under 60 per cent of the bed-days.

Figure 9 (pages 21 and 22) shows that public acute, private and repatriation hospitals treat different types of patients. Public hospitals treat a higher percentage of their patients, than do other hospitals, for conditions relating to pregnancy and childbirth, perinatal conditions, injury and accidents, ill-defined, respiratory, infections and supplementary conditions.

Private hospitals treat a higher percentage of their patients for conditions relating to the digestive system, genito-urinary systems, musculo-skeletal systems, and nervous system.

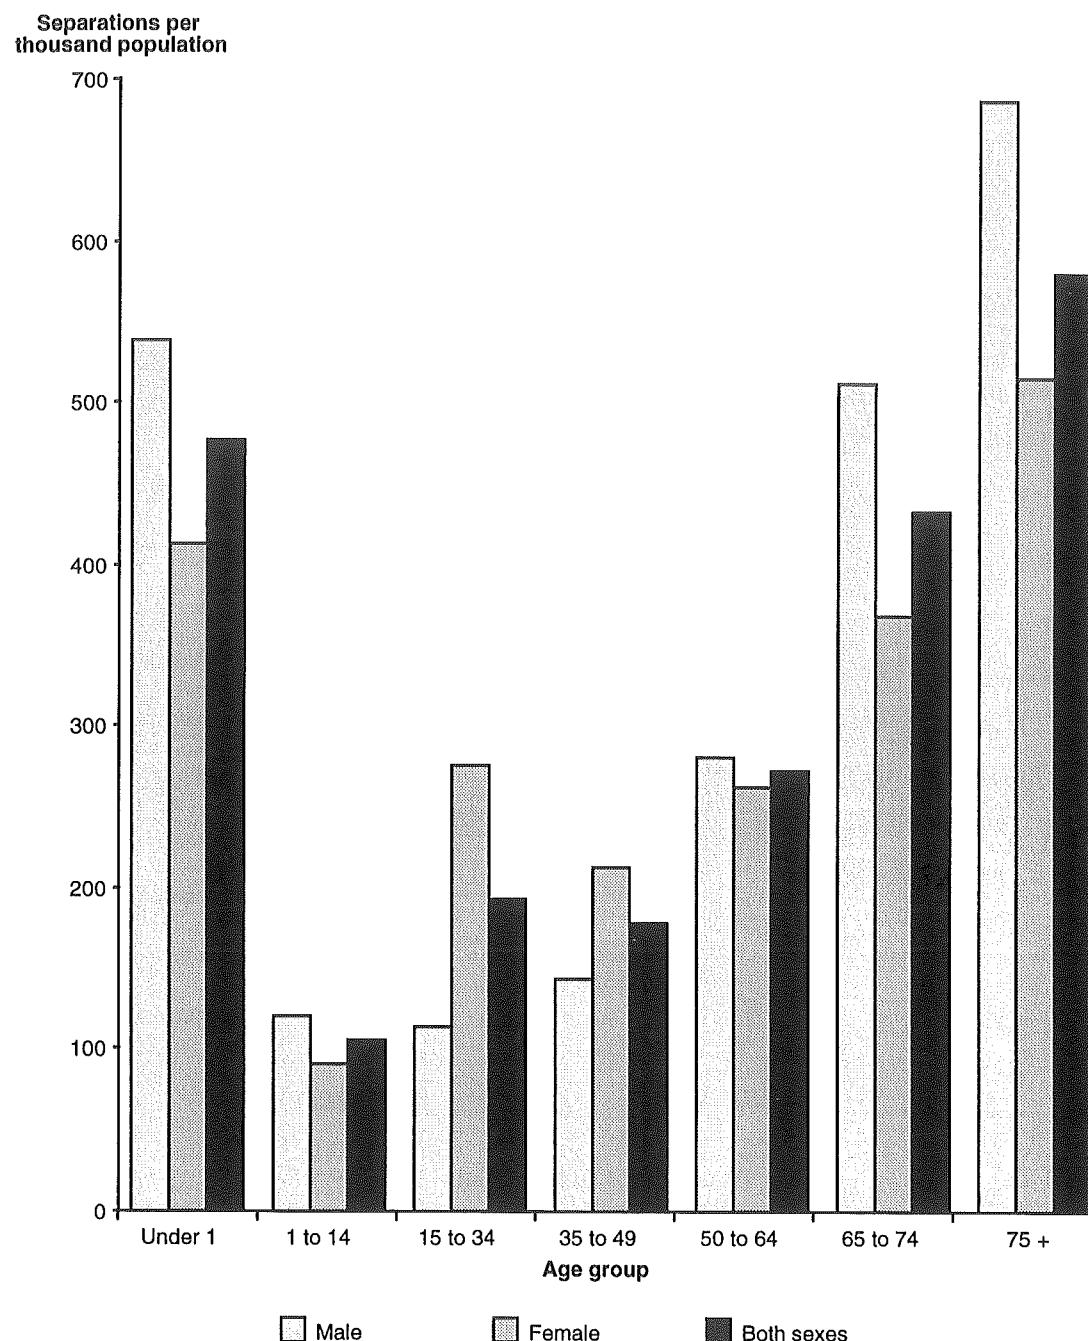

<sup>4</sup> Includes V56 which most States use to code hemodialysis.

Repatriation hospitals treat a higher percentage of their patients for neoplasms, mental disorders, and diseases of the circulatory system.

It is estimated that in 1989–90, about fifty per cent of patients in public acute hospitals and repatriation hospitals underwent a procedure (surgical, diagnostic or therapeutic) while in hospital. The proportion was much higher in private acute hospitals where almost four patients in five had at least one procedure performed.

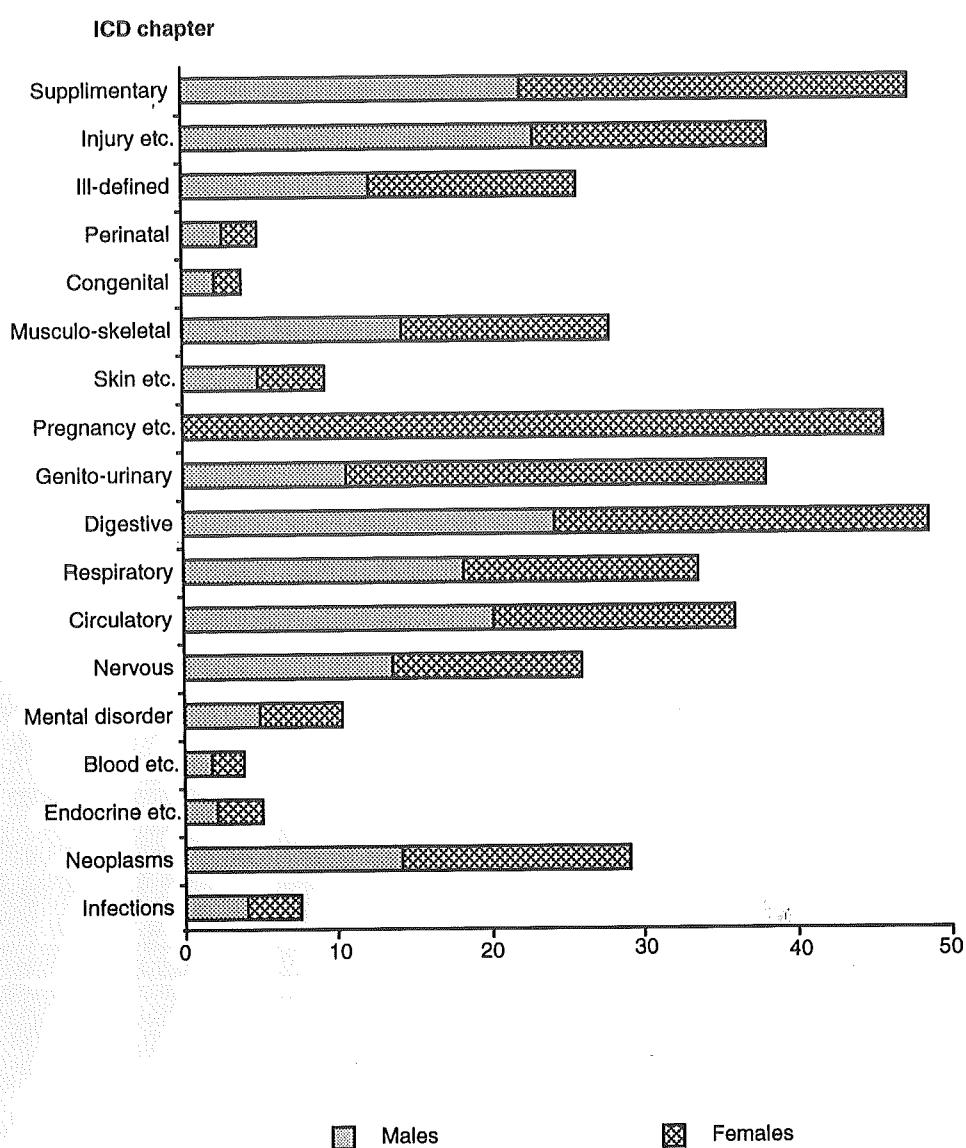

There were significant differences between hospital types in the procedures performed. For example, a much higher proportion of principal procedures in public hospitals related to pregnancy and childbirth than in private hospitals. In contrast, diagnostic procedures and incisions and excisions of joint structures were more common in private hospitals (Tables 3.3 and 3.6).

## State specific details, definitions and policy statements

Details for Tasmania and Western Australia are not listed; these State health departments preferred that readers contact them directly.

### Department of Veterans' Affairs

- renal dialysis—admitted as day only
- psychiatric—admitted as day only unless particularly in need of acute care
- dental—treated as outpatients
- perinatal—not available
- endoscopy and related procedures—admitted as day only unless otherwise indicated
- alcohol and drug—treated as outpatients
- nursing home type—not applicable to the six Repatriation General Hospitals
- rehabilitation—treated as outpatients unless otherwise indicated by a physician
- social support and non-medical—treated as outpatients.

#### Available beds

The number of beds in operation and staffed and available for admission of inpatients does not include wards which are shut for any reason.

**Note:** Beds shut within a ward should also be excluded but need to be separately identified.

#### Daily average available beds

The total number of available beds in a period divided by the number of days in the period.

#### Inpatient

A patient formally admitted to a health services facility and occupying a bed or intending to occupy a bed for the purpose of investigation, observation and/or treatment. It does not include a member of staff who is receiving treatment in his or her own quarters.

#### Admission

The formal reception of a patient for investigation, observation and/or treatment as an inpatient.

#### Discharge

The formal release of an inpatient from a health services facility. It does not include patients released for a period of leave as part of their treatment.

#### Separation

The formal release of an inpatient by discharge or death.

### **Occupied bed-day (inpatient day)**

The occupancy of a bed by a patient for a period extending from before midnight on the one day to a time before midnight on the following day.

**Note:** It includes a patient admitted and discharged within 24 hours measured from midnight to midnight of the one day (same day inpatient). The day of admission and the day of separation are counted as one day.

### **Occupancy rate**

The number of occupied bed-days expressed as a percentage of the available bed-days.

### **Daily average beds occupied**

The total number of occupied bed-days in a period divided by the number of days in that particular period.

### **Number of inpatients treated**

The total number of admissions in a period plus the number of inpatients present at the commencement of the period or the total number of discharges in a period plus the number of patients present at the end of the period.

### **Average length of stay**

The number of days on average that inpatients who separated from a hospital, in the period, occupied a bed in that hospital.

$$\text{A.L.O.S} = \frac{\text{total length of stay (occupied bed-days of all separated patients)}}{\text{total number of separated patients}}$$

### **Turnover interval**

The average time a bed is vacant between successive patients during a period.

$$\text{Turnover interval} = \frac{\text{Total number of available beds minus total occupied beds over each day of the period}}{\text{Total separations during the period}}$$

### **Refused admission**

A request for an immediate or urgent admission of an entitled person to the Repatriation General, Hobart (RGH) which is denied by the hospital because of circumstances applying at the time of request although the required service would normally be provided at the institution.

**Note:** Patients referred to non-departmental hospitals for surgery or procedures which are not provided at the RGH are excluded.

### **Deferred admission**

The deferral or delay of a planned or elective admission due to circumstances applying at the hospital at the time of the scheduled admission.

### **Occasion of service**

Any examination(s), consultation(s) or treatment(s), or other service(s) provided to a patient from an individual functional unit of a health service facility on each occasion such as service(s) is (are) provided; that is, a patient may receive a number of occasions of service on a single attendance.

**Attendance**

An attendance occurs each time a non-inpatient attends a hospital, or other centre, and receives one or more occasions of service.

**Outpatient**

A non-inpatient who attends a health services facility and who is not a day patient or casualty patient.

**Casualty (accident and emergency centre)**

A unit for the reception of patients requiring primary medical care and/or trauma patients for one or more of the following functions—examination, resuscitation, treatment, observation or admission.

**Casualty patient**

A patient who receives a casualty occasion of service.

**Same day inpatient**

A patient who is admitted and discharged within 24 hours measured from midnight to midnight of the one day.

**Note:** This will include renal dialysis, oncology, day surgery and other one day admissions.

**Day patient**

A patient who attends a day hospital or ward.

**Note:** A day hospital or ward provides courses of treatment usually of a rehabilitative nature involving non-residential patients.

# New South Wales

## Separation

The formal process whereby an inpatient leaves a hospital/area health service after completing an episode of care. Separation includes discharge to place of residence, transfer to another hospital or nursing home, or death.

## Admission

The formal process whereby a person is accepted by a hospital/area health service as an inpatient using established registration procedures.

## Inpatient

An inpatient is a person who attends a hospital for a procedure, care or observation and:

- is accommodated for at least four hours (includes overnight) for any of the above purposes; or
- because of the presenting condition needs, for clinical reasons, to be held in casualty or in an accident and emergency department for at least four hours; for example, for observation following head injury (compare [d] below); or
- is admitted for day surgery or a non-surgical day procedure and is separated on the same calendar day (day surgery patient, day procedure or medical patient); or
- attends hospital regularly as part of a planned course of treatment or care other than as an outpatient and does not require overnight accommodation (day attendee); or
- requires the use of special facilities such as an operating or endoscopy theatre.

Patients admitted through casualty or the accident and emergency department are regarded as inpatients from the time of their arrival at casualty or the accident and emergency department. Occasions of service generated prior to formal admission should not be counted in the number of non-inpatient occasions of service being reported to the department.

The following are not inpatients:

- a. members of staff receiving treatment in their quarters
- b. a newborn baby except where qualified as an inpatient
- c. patients who have simple procedures (for example, immobilisation of simple fracture or suturing of wounds not requiring operating facilities) normally carried out in casualty or accident and emergency rooms on an out-patient basis
- d. any patient who attends casualty or the accident and emergency department for treatment or care which would normally be completed in less than four hours but which extends beyond four hours due to staff treating more urgent cases, or because of other non-clinical reasons.

## Inpatient counts

*At start:* the number of inpatients currently admitted at the start of the period being reported (month/quarter), including those on authorised leave.

*At end:* the number of inpatients currently admitted at the end of the period being reported (month/quarter), including those on authorised leave.

**Admissions:** the number of inpatients who underwent admission during the period being reported (month/quarter).

**Transfer in/out:** the number of inpatients transferred in/out of the cost centre during the reporting period (month/quarter) to/from another program/sub-program within the same health service facility without admission/separation procedures being applied.

**Accounting:** inpatients are classified for accounting purposes by charging basis. Refer to the separate definitions of the corresponding patient classifications which describe the charging basis.

**Length of stay:** the number of days between admission and discharge. A day only stay (admission and discharge in the same calendar day) is defined as length of stay=1.

—**Occupied bed-day:** the total number of bed-days of all inpatients accommodated during the period being reported (month/quarter) taken from the count of the number of inpatients accommodated at midnight (approximately) each day, as recorded in the 'Daily record book' (or its computerised equivalent). Details for day only inpatients are also recorded as occupied bed-days where an occupied bed-day is counted for each day only inpatient.

—**Day only admission:** this term is used as a synonym for day only patient. A day only patient is an inpatient who is admitted and separated on the same calendar day.

—**Accounting:** day only patients are divided into accounting categories as per the charging classification of the patient. Refer to the definition for the corresponding patient classification. The classifications used for day only patients are: Non-Chargeable, Band 1, Band 2, Band 3, Band 4, Other Same Day, Compensable and Ineligible. Allocation of patients to categories should be in the following order:

1. allocate to Non-Chargeable, Compensable or Ineligible if appropriate
2. if none of those apply allocate to Band if appropriate
3. if not yet allocated count as Other Same Day.

Day only patients are also divided into four statistical categories which are: Day surgery patients, Day procedure or medical patients, Day attendees, and Other day only patients as defined below.

### **Day surgery patient**

A day surgery patient is a day only patient who undergoes a surgical procedure within Bands 2,3 or 4 of the Commonwealth Department of Community Services and Health's Day Only Schedule and who is not a day attendee (see below).

These procedures are those carried out under local anaesthetic with no sedation and less than one hour actually spent in theatre (Band 2); general or regional anaesthesia or intravenous sedation and less than one hour actually in theatre (Band 3); or general or regional anaesthesia or intravenous sedation and one hour or more actually in theatre (Band 4).

These procedures exclude those in Band 1 (which includes hemodialysis, certain endoscopy, diagnostic and minor surgical procedures, and non-surgical procedures that do not normally require an anaesthetic). Patients from Band 1 will usually be either day procedure or medical patients, day attendees (see below).

### **Day procedure or medical patients**

A day procedure or medical patient is a day only patient whose care is covered within Band 1 of the Commonwealth's Day Only Schedule but who is not a day attendee (see below). Day medical patients are mainly gastro-intestinal endoscopy patients, patients admitted for minor surgical items or patients held for observation for four hours or more.

### **Day attendee**

A day attendee is a day only patient who regularly attends hospital and whose absence between attendances does not exceed four days (10 days for mental health patients). Day attendees attend the hospital for at least four hours each time and occupy a bed (or a chair for dialysis). Day attendees include dialysis, day respite care, and ongoing rehabilitation patients.

### **Other day only patient**

An other day only patient is a day only patient who, although admitted and separated on the same day, has death or transfer to another hospital as his/her mode of separation or who signs himself/herself out of hospital on the day of admission. These patients include one-day stay trauma patients (transferred or died).

# **Victoria**

## **Separation**

Includes:

- discharge to private accommodation
- leaving hospital against medical advice
- transfer to a nursing home or to another hospital for continued treatment
- death.

It excludes discharge to leave.

## **Admission**

Refers to any patient processed through the formal admission procedure.  
Readmissions from leave are excluded.

## **Inpatient**

Any person who has been formally admitted to the hospital using established admission procedures. Because of the somewhat circular nature of the definition there is some flexibility available to hospitals in determining which categories of patients should be admitted. At the minimum, persons who occupy a registered bed for the purpose of receiving medical or surgical treatment should definitely be admitted. Persons who should be admitted include:

- any person who will occupy a registered bed for the purposes of receiving medical or surgical treatment
- day procedure patients (including patients undergoing endoscopy)
- renal dialysis patients.

## **Length of stay**

Is calculated by including the inpatient's day of admission and excluding the day of discharge (when an inpatient is admitted and discharged on a different day). If an inpatient is admitted and discharged on the same day, the length of stay is one day.

## **Occupied bed-day**

Generated for each day following admission of an inpatient (see also *Length of stay* above).

## **A same day patient**

One who is admitted and discharged on the same date.

## **Policy**

*Renal dialysis:* these patients are usually admitted as inpatients.

*Endoscopy:* these patients are usually admitted as inpatients.

*Perinatal:* a newly-born child for the first 10 days where the mother occupies a bed in a hospital is not admitted except where the newly born child occupies a bed in an intensive care unit approved under section 3(2)(a) of the *Commonwealth Health Insurance Act 1973* for the purposes of provided special care; or where there are two or more newly born children of the same mother in the hospital, each newly born child in excess of one.

*Other categories:* for the categories 'dental', 'psychiatric', 'alcohol and drug' and 'social support and non-medical', there are significant numbers of non-inpatient

services delivered. In Victoria, the categories 'intellectual handicap and developmental disability' and 'rehabilitation' are not used as non-inpatient statistical groupings.

## **Queensland**

As Queensland Health has a number of inpatient processing systems, the circumstances under which a separation or admission occur may vary. For example, within some systems a patient will be separated and readmitted in the event of a reclassification from, say, acute to nursing home type status. Procedures are not common across the State.

### **Separation**

A separation occurs when an inpatient dies or is processed through the formal separation procedure.

### **Admission**

An admission occurs when an inpatient is processed through the formal admission procedure.

### **Inpatient**

An inpatient includes any person for whom formal admission procedures have been completed. Not included are:

- members of the staff of the hospital who are receiving treatment in their own quarters
- newly-born children when the mother also occupies a bed in the hospital except in the circumstances listed below.

Newborn children (10 days or less) are considered to be inpatients if they:

- are admitted to, or remain in, hospital without their mothers; except for babies accommodated in hospital who are awaiting adoption
- require provision of special care in a pediatric intensive care facility specifically approved by the Commonwealth Minister for Health (regardless of whether or not mother is still an inpatient)
- are the second or subsequent born in a multiple birth. Each baby in excess of one is to be treated as an inpatient.

After the tenth day, normal rules for admission and separation apply to babies.

### **Length of stay**

The length of stay is the number of days between admission and separation dates, except in the case of a same day patient, where the length of stay is defined to be one day.

### **Occupied bed-day**

The occupancy of a bed by an inpatient for a period extending from before midnight on the one day to a time before midnight on the following day; and for any period within 24 hours measured from midnight to midnight on one day. Note: day benefit patients need not occupy a bed to generate an occupied bed-day.

### **Same day patient**

An inpatient admitted and discharged on the same date.

### **Policy**

The categories of patients listed in your request cannot be assigned to any standard treatment protocol. In general:

**Renal dialysis:** persons are treated on an inpatient basis.

**Psychiatric:** persons can be treated as an inpatient, outpatient or given community health-based care.

**Dental:** persons are mainly treated as outpatients but can also be treated as inpatients. A school dental service is also provided.

**Perinatal:** perinatal is defined as from immediately prior to birth to 28 days. A stillbirth is defined as the complete expulsion or extraction from its mother, of a product of conception of at least 20 weeks gestation or 400 grams birthweight, which after separation did not show any signs of life, that is, did not have a heartbeat.

**Endoscopy and related procedures:** persons are treated on an inpatient basis ( mostly day benefit ). Prior to the introduction of day benefit procedures, treatment could have been on an inpatient or non-inpatient basis.

**Intellectual handicap:** the treatment of persons can be through other government instrumentalities, in nursing homes or community medicine clinics, or as inpatients or non-inpatients.

**Alcohol and drug:** persons on these programs can be treated on an inpatient basis, as non-inpatients, at residential centres or community health centres.

**Nursing home type:** these patients are by definition inpatients in acute public hospitals.

'A Nursing home type inpatient is any person who is an inpatient who has been in one or more hospitals for a continuous period of more than 35 days and is not in need of acute care.'

**Rehabilitation:** persons can be treated as inpatients, non-inpatients or at community health centres.

**Social support and non-medical:** this is considered to be generally for non-inpatients.

## **South Australia**

### **Separation**

defined as a formal process whereby an inpatient or same day patient leaves hospital at the end of an episode of care. Separations include discharges to return home, transfers to other hospitals, nursing homes and other forms of congregate living, and deaths of persons who were inpatients or same day patients at the time of death.

### **Admission**

defined as a formal process whereby a person is accepted into hospital for the purpose of provision of inpatient or same day patient treatment. If an inpatient or same day patient is formally discharged from hospital and then returns for further treatment, the patient must repeat the admission process. Hence a second admission must be recorded in the statistics.

### **Inpatient**

a person who has been registered as a patient at a hospital, has undergone the hospital's admission procedure, occupies an approved bed for the purpose of treatment, and remains for a period beyond midnight on the day of admission.

### **Same day patient**

a person who has been registered as a patient at a hospital, has undergone the hospital's admission procedure, and is discharged prior to midnight on the day of admission.

### **Occupied bed-days**

defined as the number of whole days or part days on which beds were occupied by inpatients or same day patients. For chargeable inpatients or same day patients, their occupied bed-days are always equal to the number of days for which accommodation charges are billed. In counting the occupied bed-days of patients, the day of admission and day of separation are counted as one day. For charging purposes the day of admission is to be used when counting the day of admission and day of separation as a single day for calculating the fee payable.

The above definitions are extracted from the guidelines which the Commission issues to hospitals for reporting to the Monthly Management Summary System (MMS). The latest guidelines apply from 1 July, 1990. There are a set of additional notes provided in the guidelines which clarify some of the potential 'grey areas' associated with the application of the definitions.

### **Length of stay**

Note that the above definition for occupied bed-days essentially defines the length of stay for a given episode of care for inpatients and same day patients. In particular, it follows that the length of stay for a same day patient will be one day.

When calculating average length of stay for a given period of time the Commission applies two different standards. The first uses information from the hospital morbidity collection (ISIS), which is separation-based. The average length of stay is calculated as the accumulated occupied bed-days for completed episodes of care (that is, for patients who have been discharged during the reference period) divided by the number of completed episodes. Thus, this is a true average for those patients discharged during the reference period.

The second method divides the total occupied bed-days recorded in the reference period by the total admissions recorded in that period. This is derived from the MMSS collection, which records aggregate hospital activity on a monthly basis. Average length of stay calculated by this method therefore includes only the occupied bed-days for the portions of episodes of care that overlap the reference period.

#### **Additional notes**

##### **1. The boundary between inpatients and same day patients**

The following factor should be taken into consideration when classifying doubtful cases.

*Type of treatment:* the inpatient is receiving care which requires an overnight stay. Conversely, the same day patient is receiving a type of care which does not require an overnight stay in hospital.

##### **2. The boundary between same day patient and non-inpatients**

The following factor should be taken into consideration when classifying doubtful cases.

*Type of treatment:* the same day patient is receiving care which involves a prolonged procedure or a post-procedural recovery period; whereas the non-inpatient is receiving simpler and less prolonged treatment. Whether or not a patient actually occupies a bed (approved, staffed or otherwise) is not relevant to classification as same day patient or non-inpatient. For statistical purposes the classification used must coincide with that used for billing purposes.

##### **3. Classifying casualty, outpatients and private non-inpatients**

A person who attends the hospital and who is not admitted should be recorded as either a casualty patient, an outpatient, or a private non-inpatient.

If the patient is treated by a doctor, who subsequently bills that patient directly, then an attendance should be recorded under the private non-inpatient section of the MMSS form. All other patients will either be recorded under the casualty or outpatient section of the form.

If the patient attends the hospital for 'emergency-type' treatment (unplanned), then an attendance should be recorded under the casualty section of the form. Note that if this patient is subsequently admitted, then an attendance should be recorded under casualty and the subsequent admission as an inpatient or same day patient should also be counted.

If the patient attends the hospital on an appointment basis (planned), then an [attendance and/or] occasion of service(s) should be recorded under the outpatient section of the form.

##### **4. Compensable patients admitted to a country hospital**

All compensable patients must be admitted as compensable private in country hospitals which do not employ full-time salaried medical specialists.

Classification of a compensable patient as a compensable private patient cannot be overridden by the patient wishing to be classified as a compensable hospital patient. However, if the patient's status reverts to non-compensable, the patient should be classified as home type, and will be billed accordingly. It is essential, therefore, that recertification, where applicable, be made before the expiry date of their certificate.

The doctor's decision should be made on the basis of prognosis: is the patient expected to recover (and has therefore an acute condition), or is this patient

chronically ill and not expected to recover? Classification as 'acute' must not be based on the length of treatment but on severity of condition being treated.

This judgement is made in respect to the principal condition; that is, the main cause of hospitalisation. Thus, an elderly infirm patient not expected to recover sufficiently to leave the hospital must be classed as nursing home type, and remain so, even if they have a temporary secondary condition such as a broken limb. The principal condition (elderly infirm) will remain after the secondary 'acute' condition terminates.

The only circumstance in which a nursing home type patient can be re-classified as acute type is when there is a revision of the doctor's opinion regarding prognosis. This will seldom occur.

If a patient is certified as acute type, a portion of the fees (the 'patient contribution') is automatically waived for the duration of the certificate. This does not affect the Board of Management's authority to remit all or part of any other patient's fees in cases of hardship.

It should be noted that certification as acute type relates to the present and expected future prognosis of the patient and cannot be made retrospective, nor taken as altering any past liability of the patient to pay fees.

##### **5. Notes on pension rights of long stay inpatients**

Hospital staff should provide help to long stay inpatients, who may not be aware of their pension rights.

In particular, long stay (nursing home type) inpatients may be eligible to receive supplementary assistance if they are paying the patient contribution. If an inpatient is expected shortly to become a long stay (nursing home type) inpatient, arrangements should be made for an application for supplementary assistance to be lodged with the Department of Social Security (DSS). The DSS will provide detailed advice on this and other pension matters on request.

##### **7. Newly-born children**

The following criteria should be applied in determining whether a newly-born child is to be classified as an Inpatient:

- a newly-born child is one who is 10 days old or less;
- a newly-born child, whose mother is an Inpatient of the hospital, is not an inpatient except that:
  - the child is admitted in its own right
  - the child is the second or subsequent birth of multiple births.

# Australian Capital Territory

Note: Normal newborns are not included in the data.

## **Available bed (inpatients)**

Related definition—*inpatients*

The number of beds which are immediately available to be used by admitted patient/clients or residents if required; that is, they are located in a suitable place for care and there are nursing and other auxiliary staff available, or who could be made available within a reasonable period, to service patient/clients who might occupy them. Treatment chairs (example: renal dialysis) and trolleys (example: gastroenterology) are included in the count. Available beds are reported monthly, quarterly and annually as an average. The number of beds as at the end of the financial year is also reported.

Exclude: surgical tables, recovery trolleys, delivery beds, cots for normal neonates, emergency stretchers/beds and beds designated for same day inpatient care.

For average bed numbers, beds in wards which were closed for any reason should not be included except where beds are in wards staffed and available for five days per week and closed only on weekends.

The average is to be calculated from monthly figures, or the basis for calculation is to be stated.

## **Average length of stay (ALOS) (inpatients)**

ALOS = Occupied beds-days/separations for a period—usually a month, quarter or financial year.

## **Inpatient**

A patient/client who is formally admitted to a health service facility—includes, for example, dialysis, minor theatre, gastroenterology and chemotherapy.

## **Outpatient (non-inpatient)**

A non-admitted patient/client who receives health care from a hospital staff member on a hospital site through emergency and outpatient clinics; and/or as outreach/community patient/client, that is, treated by hospital employees off site.

## **Occasion of service**

An occasion of service is any instance of clinical examination, assessment, consultation, therapy, counselling, domiciliary care, health education, health promotion or community development activity provided by a service deliverer to a registered patient/client, a member(s) of the immediate family or non-institutional carer. Where the patient/client and/or more than one other member of the immediate family etc. are in attendance, this still constitutes one occasion of service for single patient/client services. The service can be provided on a face-to-face basis or, in certain circumstances, over the telephone.

One separate occasion of service should be counted for each separate occasion where a single patient/client receives one or more services from a different health professional discipline and where the treatment/counselling given is sufficient to warrant a substantial notation in the patient/client record for each service deliverer. A service provided to a patient/client's immediate family or carers is also counted as an occasion of service. A case conference with a client, family and/or carer in attendance is counted as an occasion of service. Carer refers only to non-institutional carers, that is, home-based care givers.

A telephone consultation can be counted as one occasion of service only if the contact has had significant therapeutic content and is sufficient to warrant a notation in the records of that patient/client. If during the course of an initial telephone contact substantial support or counselling is provided and the contact directly results in registration/referral of the patient/client or an notation in the daily records, the initial telephone contact may be counted as a separate occasion of service.

Where there is more than one service deliverer present, the additional service deliverer can count the occasion of service as a separate occasion of service only if it is essential to have each service deliverer present.

Criteria for essentiality could include whether each service deliverer is providing a different area of specialist expertise; whether the volume of work is such to require more than one service deliverer; or whether the complexity of the problem being dealt with requires this.

Activities which should not be counted as a separate occasion of service include:

- Telephone calls for the purpose of making appointments or passing on the results of tests
- Third party referral—the arrangement and follow up of a referral of a patient/client to a person other than the primary health professional
- Case conference—a meeting designed to discuss the care of the patient/client (unless the client or a family member is in attendance)
- Intake meeting—discussion and allocation of a patient/client/s to specific health professionals
- Service coordination/liaison—contacting of and liaising with other agencies to assist with or organise a service on behalf of a patient/client
- Record keeping/administration—the writing of notes in an administrative task associated with a patient/client record.

### **Occasions of service for multi-client/group services**

A multi-client service is provided by a service deliverer to two or more clients and is defined as follows:

**Client group service:** for example, therapeutic group sessions. The extent of service provision is sufficient to warrant a substantial notation in the patient/client record or a specific group record.

**Open group service:** for example, lectures, group classes, public education programs, media contracts such as radio broadcasts, and information stalls.

**Sequential group service:** for example, where patient/clients are individually attended to, in successive order, with essentially the same short or routine service, for example, screening programs. Example: The mass immunisation of 150 children at a school by 5 health professionals would be counted as 5 occasions of service.

A multi-client service should be counted similarly to single patient/client services, that is, one occasion of service for each separate occasion where one or more services are delivered. However, it is also necessary to count the number of people attending each occasion of service. Additionally, the method of record notation may not be in the form of patient/client records. It is necessary to maintain a suitable record for the kind of activity; for example, for patient/client therapy groups, the patient/client records may be appropriate; for larger education groups a group record could be kept noting description of group objectives, process and evaluation; member names; attendances at each session; and any specific incidents.

Where there is more than one service deliverer, the additional service deliverer should count the occasion of service as a separate occasion of service only if it is essential to have each

service deliverer present. Similar criteria to those set out for single patient/client occasion of service should be used to determine essentiality.

**Example 1:** a therapeutic group session for eight patient/clients which runs for two and three quarter hours with three service deliverers present, one of whom is there for the entire session and the other two are present for an hour each, would be counted as a total of three occasions of service (ie, with each service deliverer counting one occasion of service each).

**Example 2:** a daily activity group session for 10 clients including physiotherapy, workshops and involving three service deliverers, will be counted as a total of three occasions of service.

**Example 3:** at a day care centre where a patient/client is present as part of a group session, but also receives individual service (for example, nurse does a dressing). The patient/client's activities should be recorded both as part of the group session and as individual occasion of service for the absent period.

The following activities should not be counted as or with a group occasion of service:

- planning and preparation
- telephone contact, for example, time taken to organise a venue, child minding, to take bookings, arrange appointments, etc.
- travelling and/or transport
- evaluation
- service co-ordination/liaison
- administration, for example, record keeping and other administrative tasks associated with group services
- training/supervision of other health personnel or students in the course of the group service
- case conference
- intake meeting.

Note: consultation, advice, education and support services to non-clients: Consideration was given to the collection of information relating to this category which would include liaison with schools and work place environments, professional case conferencing, etc. Departments may keep information on this activity as relevant, but it is not to be considered as an occasion of service. These activities will be recognised through the development of activity standards.

### **Community development services**

A community development activity is one which assists and involves the local community in improving its health through such activities as development and maintenance of community and self help groups, providing information and developing submissions to facilitate the allocation of resources for health-related matters. Examples of community development activities are: working with a community group to establish a playgroup, assisting a community group to prepare a submission for funds to set up a parent support program, or establishing a friendly visiting service for a patient/client group.

**Example:** a staff member meets with a group of 12 parents of children with chronic illnesses to establish better community support networks. Meeting is of two hours duration. This equates to one occasion of service and eight units of service.

### **Occupied bed-days (OBDS) (inpatients)**

The total number of days of stay for inpatients (all clients who were formally admitted for an episode of care) and who underwent separation during the financial year. For each client the number of occupied bed-days is calculated as:

separation date minus admission date; except for same day inpatients who will be included as a stay of one day (NMDS).

For monthly and quarterly reporting purposes, occupied bed-day equates to: separation date minus admission date (within the month) plus separation date minus first of the month (admission prior to beginning of reporting period) plus end of month minus admission date (admission during month but not separated) plus same day inpatients.

*or*

Midnight bed count plus same day inpatients.

### **Other inpatient**

Related definition—*inpatient*

A patient who is admitted to hospital and whose length of stay is greater than one day; that is, admission date does not equal separation date.

### **Percentage occupancy (inpatients)**

Percentage occupancy=occupied bed-days/available bed-days × 100.

### **Same day inpatient**

Related definition—*inpatient, other inpatient*

A patient/client who is admitted and separates on the same day; a booked or emergency patient/client.

### **Separation**

When a patient is formally separated from the hospital through recognised discharge procedures at the end of an episode of care; because of death; because of transfer to another hospital or inpatient institution for more than 7 days; because the patient was reclassified to nursing home or rehabilitation status.

## **Northern Territory**

### **Separation**

Separation is the date on which a patient was formally separated from the establishment or on which status transfer occurred. Discharge should occur as soon as medical status allows. Discharge time is when the discharged patient leaves the ward area.

### **Admission**

Admission to hospital is solely on the basis of medical need. Admission to hospital for emergency care should not be delayed because of financial consideration. The time of admission to hospital for accident and emergency patients is taken as the time the decision to admit is made. In the case of booked admissions, it is the time the patient is formally admitted.

### **Inpatient**

An inpatient is a person who has been admitted to hospital, occupies an approved bed for the purpose of treatment, and remains for a period beyond midnight on the day of admission for the purpose of receiving professional attention and treatment. This definition also applies to day patients undergoing procedures such as endoscopy, that cannot be managed properly on an outpatient basis. (Outpatient status is retained until a decision is made to admit.) Boarders and newborn babies are not usually inpatients.

Criteria applied in determining whether a newly born baby is to be classified as an inpatient is as follows:

- a newly-born baby is one who is 10 days old;
- a newly-born baby, whose mother is an inpatient of the hospital, is not an inpatient unless a multiple birth occurs, then each baby other than the first is deemed to be an inpatient;
- where a newly-born baby occupies an approved bed in a pediatric intensive care facility, the baby is deemed to be an inpatient. (Royal Darwin and Alice Springs hospitals only apply);
- if a newly-born baby is receiving hospital treatment and the mother is not an inpatient of the hospital, the baby is classified as an inpatient regardless of the baby's age.

### **Length of stay**

The length of inpatient stay is taken as the sum of the days the patient was actually in hospital, less one. The day of admission and the day of discharge make one day, irrespective of the number of hours. Each 24-hour absence authorised by a doctor is subtracted from the total.

### **Occupied bed-day**

An occupied bed-day is the occupancy of a bed by an inpatient for a day or part thereof. For inpatients whose length of stay was greater than one day, the day of admission and the day of discharge is counted as one occupied bed-day. Same day patients are treated as equivalent to one occupied bed-day. Same day patients are those patients who are admitted and discharged on the same day, except where the mode of separation is death.

## **Same day patient**

Any patient admitted for inpatient treatment and who is discharged the same day is called a same day patient. Same day patients are counted as one day for statistical purposes.

## **Policy**

The following are policy statements for the treatment of the following categories of patients:

**Renal dialysis:** acute dialysis only is undertaken in hospitals. Routine maintenance renal dialysis is based in Community Health Centres.

**Psychiatric:** no psychiatric hospitals exist within the Northern Territory; acute psychiatric patients are admitted to a public hospital. Community-based care is given following discharge.

**Dental:** the Northern Territory Dental Health Service provides public health dental services. These include dental health education and preventive dentistry—including restorative dentistry. These specific dental health programs are provided free of charge to the following priority groups: infants, pre-school and primary school children, secondary school students up to 17 years of age, rural communities disadvantaged by distance from facilities, the economically disadvantaged and their dependents, physically and mentally handicapped people, refugees (for 6 months after arrival), and prisoners in Northern Territory gaols (routine care after 6 months). Emergency treatment may be given in hospital. No dentist routinely operates within a public hospital. However, an oral surgeon is employed.

**Perinatal:** perinatal is defined as from immediately prior to birth to 28 days. (A stillbirth is defined as the complete expulsion or extraction from its mother, of a product of conception of at least 20 weeks gestation or 400 grams birthweight, which after separation did not show any sign of life.)

**Endoscopy and related procedures:** these procedures are undertaken wherever possible on a day basis in acute hospitals. The Northern Territory has no free-standing day hospitals.

**Intellectual handicap and development disability:** persons with these problems are admitted for acute care problems. Maintenance care is provided within the community.

**Alcohol and drug:** detoxification and Alcohol Dependency Treatment Programs are undertaken within or on campus of some hospitals. Additional services for these persons are also provided in the community.

**Nursing home type:** after 35 days admission, long stay patients are automatically classified as nursing home type patients—with the exception of acute care patients (an acute care certificate must be issued by a medical practitioner). The 35 days period does not include any leave of absence, but includes previous hospitalisation if the patient had been discharged and re-admitted within 7 days for the same medical condition. Hospitalisation in another hospital is also taken into account. A patient, who has been classified as nursing home type patient, may be reclassified as an acute care patient at any time at the discretion of the treating medical practitioner. In such cases, a certificate is required.

**Rehabilitation:** rehabilitation is undertaken in a community location apart from immediate post-operative rehabilitative care.

**Social support and non-medical:** allied health professionals including physiotherapists, occupational therapists and social workers who are attached to the larger hospitals. In smaller hospitals, the disciplines that can be recruited may cover community and hospital needs.
