Congenital malformations, 1981–1997

This report contains national data on congenital malformations among births that occurred in the period 1981 to 1997. Data for the years up to 1996 were published previously in *Birth Defects Series Number 3* (Hurst, Shafir, Day & Lancaster 1999). This report is only available electronically from the NPSU website (see www.aihw.gov.au/npsu/cm97.pdf). Data for the years up to 1998 will be published as *Birth Defects Series Number 4* later in 2001.

The data in this report were obtained from numerous sources. We gratefully acknowledge the collaboration of the following groups: State and Territory health departments in New South Wales, Victoria, Queensland, Western Australia, South Australia, the Australian Capital Territory and Northern Territory; in Tasmania, the State Committee of the Royal Australian College of Obstetricians and Gynaecologists, and the Department of Health and Family Services; and the staff of birth defects registries in New South Wales, Victoria, South Australia and Western Australia.

We are also grateful to the many clinicians, midwives, medical record administrators, pathologists and cytogeneticists, who complete notification forms and provide additional information when requested.

Criteria for inclusion

Congenital malformations are anatomical defects or chromosomal abnormalities that are present at birth. Major congenital malformations are either lethal or significantly affect the individual's function or appearance. Minor malformations do not have functional or cosmetic importance but may sometimes signify an underlying genetic disorder. Although infants with only minor malformations may be included in State birth defects registers, these infants are not notified to the AIHW National Perinatal Statistics Unit unless major malformations are also present.

Major congenital malformations diagnosed in liveborn infants in the first 28 days, or in stillbirths of at least 20 weeks' gestation or 400g birthweight, are included in this report. If terminations of pregnancy occurred at gestational ages of 20 weeks or more, these fetuses are included in the figures for stillbirths.

Data processing

Data on congenital malformations are coded in each State and Territory by the groups responsible for perinatal data collection and birth defects registers. Major congenital malformations and chromosomal abnormalities listed in the chapter on congenital anomalies in the Ninth Revision of the International Classification of Diseases (ICD) are notified to the NPSU. In due course, ICD-10 will replace ICD-9 for classifying congenital malformations. The NPSU and the States and Territories use the British Paediatric Association (BPA) Classification of Diseases, which is a 5-digit system compatible with ICD at the 4-digit level, to code congenital malformations. The BPA classification enables more specific coding of malformations and, with some modification of codes for malformation syndromes, limb reduction defects and other selected malformations, has been used by the NPSU since 1981. If notification forms contain information on which side of the body is affected by a malformation, this information is coded by the NPSU.

Whenever possible, coding by State and Territory groups and the NPSU is based on written descriptions of congenital malformations. Further information is requested if diagnoses are doubtful or if key data items such as maternal age are missing. While this report gives widely accepted definitions of selected major congenital malformations, it is not always possible to ensure that notified diagnoses of malformations conform to these definitions.

Contents of report

Data in all tables are based on the year of birth, or the year of induced abortion, and on the State or Territory in which the birth or termination of pregnancy occurred. Denominators for calculating rates are based on the State or Territory of registration, obtained from the Australian Bureau of Statistics for the years 1981 to 1990, and are obtained from State and Territory perinatal data collections for the years 1991 to 1997 (ABS 1996; ABS 1997; Day et al. 1997; Day et al. 1999). Malformation rates are expressed per 10,000 total births, including those malformations that are specific to one sex. As the criteria used by the States and Territories for their published reports may differ from those used here, their numbers and rates may differ from those in this report. Also, the criteria and sources of notifications vary among the States and Territories, so differences in malformation rates should be interpreted cautiously. Small numbers of specific types of malformations may also influence variations in rates.

Tables 1–7 are similar in content to annual tables published previously. Tables 1–4 give national data, and data for each State and Territory, on the total number of infants and fetuses with major congenital malformations in the years 1981 to 1997. In Tables 5–7, State/Territory and national data are given on major malformations affecting all anatomical systems. National data are presented separately for 1981–1995, 1996, 1997 and the whole period; data on selected malformations in each State and Territory are given for the same years.

Table 8 gives the annual number of live births, stillbirths and total births, by State and Territory, for the years 1981 to 1997.
