

# 7 Administrative data for admitted patients

## Introduction

This chapter presents a summary of patient-level administrative information, covering admitted patient election status, funding source, cross-border flows, care type, urgency of admission, mode of admission, mode of separation, inter-hospital contracted patient status and hospital-in-the-home care. The data are derived from the AIHW's National Hospital Morbidity Database, a compilation of patient-level data for separations from public and private hospitals in Australia (see *Chapter 1*). Separations were included for all care types except *Newborn* episodes that did not include qualified days and records for *Hospital boarders* and *Posthumous organ procurement*. However, tables 7.11, 7.12, 7.13 and 7.14 also include *Newborn* episodes without qualified days.

For the purpose of reporting these data, the patient election status for patients whose funding source was reported as *Australian Health Care Agreements* and *Reciprocal health care agreements* was categorised as public. The patient election status for patients whose funding source was reported as *Private health insurance*, *Self-funded*, *Workers compensation*, *Motor vehicle third party personal claim*, *Other compensation*, *Department of Veterans' Affairs*, *Department of Defence* or *Correctional facility* was categorised as private. For patients whose funding source was reported as *Other hospital or public authority*, *Other*, *No charge raised* or *Not reported*, the patient election status was categorised according to the reported admitted patient election status.

Caution should be taken when making comparisons with *Australian hospital statistics* reports published before 2002–03 as the categories presented in tables 7.1 to 7.5 are not directly comparable because of changes in the data elements used (see *Appendix 1* for more information).

## Patient election status and funding source

### Changes from 2003–04 to 2007–08

Table 7.1 presents the number of separations and patient days by patient election status, funding source and hospital sector for the years 2003–04 to 2007–08. Between 2003–04 and 2007–08, the number of separations for private patients for both sectors combined increased by an annual average of 4.6%, and separations for public patients increased by an annual average of 2.7%. Between 2006–07 and 2007–08, public patient separations increased by 1.9% and private patient separations increased by 5.4%. Between 2006–07 and 2007–08, the number of separations for private patients in public hospitals increased by 5.3%. Over the same period, the number of separations for public patients in private hospitals decreased by 6.3%. However, the re-categorisation of two Western Australia hospitals and one Tasmanian hospital affected the reporting of data by sector and patient election status. For Western

Australia, the two hospitals were reported as private hospitals from 2003–04 to 2005–06, and as two public and two private hospitals for 2006–07 and 2007–08. For Tasmania, one hospital was reported as a public hospital for 2003–04 to 2006–07, and as a public hospital for 4 months of 2007–08 and a private hospital for the remainder of 2007–08.

The proportion of total public hospital separations that were for *Department of Veterans' Affairs* patients decreased from 3.3% in 2003–04 to 2.6% in 2007–08. Over the same period, the proportion of separations in private hospitals that were for *Department of Veterans' Affairs* patients decreased from 7.8% to 6.4%.

## State and territory overview

Tables 7.2 to 7.6 present data on patient election status and selected funding source categories. Accompanying tables published on the Internet present all funding source categories. The funding source categories (HDSC 2006) provide information about the principal source of funds for an admitted patient episode.

There may have been some variation between jurisdictions in the definitions used for the funding source categories and in the way in which state- or territory-level data were mapped to the *National health data dictionary* format. In particular, Tasmania was not able to identify separations whose funding source was *Self-funded* in public hospitals. Therefore, the number of separations for this category may be underestimated, whereas the number of separations in the funding source categories of *Private health insurance* and *Other private* may be overestimated.

Public patients accounted for 52.7% (4.1 million) of all hospital separations, 98.2% in public hospitals (4.1 million) (Table 7.2). Patients whose funding source was reported as *Private health insurance* made up 62.6% of private patients in public hospitals, 82.1% of private patients in private hospitals and 37.0% of all separations. *Department of Veterans' Affairs* patients made up 4.1% of all hospital separations.

Overall, more than 0.9% of patients were funded by *Workers compensation* (73,500 separations), and 0.3% were funded by *Motor vehicle third party personal claims* (26,700 separations). About 55% of these compensable separations – 18% for *Motor vehicle third party personal claims* and 68% for *Workers compensation* – were in private hospitals.

In both sectors combined there were 190.9 separations per 1,000 population (age-standardised) for public patients, compared with 148.9 for private patients (Table 7.3). The latter figure is underestimated because data were not available for all private free-standing day hospital facilities in the Australian Capital Territory and Northern Territory (see Appendix 2 for further details). The Northern Territory recorded the highest public patient separation rate for public hospitals (461.1 per 1,000). The separation rate for public patients in private hospitals in Western Australia (18.2 per 1,000) was markedly higher than the national rate (3.4 per 1,000).

Table 7.4 presents the average cost weight of separations in each state and territory by hospital sector, patient election status and funding source. The table has been restricted to separations with a care type of *Acute, Newborn* (with at least one qualified patient day) or for which the care type was *Not reported*. In the public sector, the average cost weights for private patients were higher than those for public patients for all states and territories. In the public sector, patients whose funding source was reported as *Motor vehicle third party personal claim* had average cost weight markedly higher than other funding source categories. In the private sector, private patients whose funding source was reported as *Self-funded* had the

lowest average cost weight. More detail about the Australian Refined Diagnosis Related Group (AR-DRG) classification and cost weights is included in *Chapter 12*.

Table 7.5 shows the number of patient days reported for each funding source category, by state or territory and hospital sector. Public patients accounted for 58.0% of total patient days, and *Private health insurance* funded patients accounted for 31.0% of patient days in all hospitals.

## Age group

Table 7.6 presents the number of separations by patient election status, funding source, age group and hospital sector. For all hospitals, the most common age group for separations with an election status of *Public* was 65–74 years, accounting for 15.7% of *Public patients* in public hospitals and 21.3% of *Public patients* in private hospitals. Overall, patients aged 85 years or older accounted for 3.8% of separations with a funding source of *Private health insurance*, and 36.8% of all separations with a funding source of *Department of Veterans' Affairs*. Patients aged 25–34 years were in the most common age group for separations with a funding source of *Self-funded* (15.8% of separations in public hospitals and 16.1% of separations in private hospitals). About 23% of all separations with a funding source of *Motor vehicle third party personal claim* were for patients aged 15–24 years.

Funding source varied within age groups. For example, 28.1% of separations for patients aged 85 or older years reported a funding source of *Department of Veterans' Affairs*, and for those aged 15–24 years, 27.9% of separations reported a funding source of *Private health insurance*.

## Cross-border flows

For cross-border flow information, the state or territory of usual residence is reported as:

- one of the six states
- the Australian Capital Territory
- the Northern Territory
- other Australian territories (including Cocos (Keeling) Islands, Christmas Island and Jervis Bay Territory)
- not elsewhere classified (including resident overseas, at sea or no fixed address) (tables 7.7 to 7.10).

Table 7.7 presents the number of separations and age-standardised separation rates per 1,000 population in each jurisdiction by the state or territory of usual residence of the patient and hospital sector. Overall, 97.4% of separations (7.7 million) were for patients who were treated in their state or territory of residence. However, in the Australian Capital Territory, only 75.1% of public hospital separations were for Australian Capital Territory residents (61,000), with most of the remainder being residents of New South Wales. This is because the Australian Capital Territory is a referral centre for surrounding districts of New South Wales.

Table 7.8 presents the number of separations in each jurisdiction by state or territory of usual residence and patient election status. In Queensland hospitals, almost 76% of separations where the patients' state of usual residence was New South Wales were for private patients.

For most states of usual residence, the age-standardised separation rate was higher for public patients than for private patients. However, for separations for patients whose state of residence was Queensland, the separation rate for private patients was higher than that for public patients.

The average cost weight of separations for each state and territory is presented in Table 7.9 by hospital sector, and by state or territory of usual residence. This analysis is for separations with a care type of *Acute*, *Newborn* (with at least one qualified patient day) or for which the care type was *Not reported*. Generally, average cost weights in both the public and private sectors were higher in all jurisdictions for interstate patients than for patients resident in the state of hospitalisation. Caution should be used in the interpretation of these data as the average cost weight for a small number of interstate patients can be inflated by the occurrence of relatively small numbers of separations with high cost weights. Public sector separations for Northern Territory residents had higher average cost weights in almost all other states and territories compared with the Northern Territory. In part, this reflects a tendency for Northern Territory residents who require more complex treatment to attend hospitals in other states.

The notional cost of public patient separations for each state and territory of hospitalisation by state or territory of usual residence is presented in Table 7.10, based on the estimated average cost of the AR-DRG for each separation. This table has been restricted to separations for which the admitted patient election status was reported as *Public* and with a care type of *Acute*, *Newborn* (with at least one qualified patient day) or *Not reported*. These figures do not represent actual expenditure on these separations. These figures should also not be interpreted as an estimate of the total cost of public patients as they do not include estimates of costs for separations with non-acute care.

For the reporting jurisdictions, using these notional estimates, approximately 96% of the estimated cost of public patients is for patients treated within their state or territory of residence. For Western Australia, more than 99% of the notional cost of public patients was for Western Australian residents.

## Care type

Care type defines the overall nature of a clinical service provided to an admitted patient during an episode of care. Definitions of each care type are summarised in the *Glossary*.

Not all states and territories supplied detailed information for rehabilitation and palliative care. For rehabilitation, a category of *Rehabilitation – not further specified* was used by some states and territories and is included in tables 7.11, to 7.14. Because of the small number of separations reported in the palliative care subcategories, all palliative care separations have been reported as *Palliative care* in tables 7.11 to 7.14, without disaggregation into subcategories.

The *Newborn* care type is used for all patients aged 9 days or less at admission. *Newborn* episodes of care comprise separations with qualified days only, separations with a mixture of qualified and unqualified days, and separations with unqualified days only. Most states and territories have implemented this *Newborn* definition; however, Tasmania and the Northern Territory did not report *Newborn* separations according to the *National health data dictionary* definition (see the *Glossary* and *Appendix 1*). Additionally, some states and territories reported data for *Hospital boarders* and *Posthumous organ procurement*, for which categories are included in the care type data element. These activities are not considered to be admitted

patient care, so records relating to these activities have been excluded from this report. See Appendix 1 for more detail.

Table 7.11 presents the number of separations for each care type. For public and private sectors combined, 93.2% of separations were classified as episodes of *Acute care*, 3.5% as *Newborn* and 2.4% as *Rehabilitation care*. There was some variation among the states and territories and between the public and private sectors. For example, the proportion of public hospital separations for *Rehabilitation care* ranged from 0.5% (470) in the Northern Territory to 2.7% in Australian Capital Territory (2,200).

*Newborn* separations without any qualified days have been included in tables 7.11 to 7.14 only in this report and, as such, will cause total separations in tables 7.11 and 7.13 to differ from those of other tables. They accounted for 224,000 separations, the majority (179,000 or 79.8%) in the public sector.

The average length of stay for episodes of *Acute care* in public hospitals (3.1 days) was longer than that for private hospitals (2.3 days) (derived from tables 7.11 and 7.12). The patient days for *Newborn* episodes with a mixture of qualified and unqualified days are presented separately as the number of qualified days and the number of unqualified days. In the public sector, the average length of stay for these 'mixed' *Newborn* separations was 3.1 qualified days and 2.2 unqualified days, compared with 10.6 days for *Newborn* separations with qualified days only and 2.6 days for *Newborn* separations with unqualified days only. In the private sector, the average length of stay for these 'mixed' *Newborn* separations was 3.9 qualified days and 3.7 unqualified days, compared with 6.3 days for *Newborn* separations with qualified days only and 4.3 days for *Newborn* separations with unqualified days only.

The rate per 1,000 for *Acute care* separations was 209.4 in public hospitals and 135.2 for private hospitals. In the public sector, the separation rate per 1,000 for *Newborn* episodes (11.0) was higher than in the private sector (3.0). The rate for separations for all other *Non-acute care* was 5.8 per 1,000 in both public and private hospitals (Table 7.13).

The rate per 1,000 for *Acute care* patient days was 647.9 in public hospitals and 305.4 for private hospitals. The rate for patient days for all other *Non-acute care* was 137.6 per 1,000 in public hospitals and 38.5 in private hospitals. In the public sector, patient days per 1,000 for *Newborn* episodes (20.3) were higher than in the private sector (4.7) (Table 7.14).

## Non-acute care

Table 7.15 presents information by patient election status and mode of separation (see note on variations in the use of separation modes below) for separations with a non-acute care type—*Rehabilitation care*, *Palliative care* and *Other non-acute care* (which comprises *Psychogeriatric care*, *Geriatric evaluation and management* and *Maintenance care*). Data on patients receiving non-acute care may provide information relevant to continuity of care.

Overall, 51.0% of all separations with non-acute care were in public hospitals and 41.8% of non-acute patients elected to be treated as public patients. For separations with non-acute care, the most common mode of separation was *Other*, which includes discharge to usual residence/own accommodation/welfare institution (74.0%), 6.1% reported a separation mode of *Discharge/transfer to a residential aged care service*, 5.5% reported a separation mode of *Discharge/transfer to an(other) hospital (acute or psychiatric)* and 5.6% had a separation mode of *Statistical discharge – type change* (indicating that the patient remained in the same hospital to receive other care) (see Table 7.14). There was some variation between hospital sectors in the modes of separation reported for non-acute care. For example, 8.7% of separations for

non-acute care in public hospitals were transferred to another hospital (acute or psychiatric), compared with 2.3% in private hospitals. There was also variation in the mode of separation by type of non-acute care, as 86.3% of separations for *Rehabilitation care* reported a separation mode of *Other*, compared with 30.8% of separations for *Palliative care* and 49.3% for *Other non-acute care*.

Table 7.16 presents information by age, sex and mode of separation for separations for non-acute care. The majority of separations for patients whose care type was reported as *Rehabilitation care* were for females (56.1%), and almost half of the female patients were aged 75 years and over (47.9%, 51,400 separations). For *Palliative care*, the majority of separations were reported for males (55.5%), and 87.7% of all *Palliative care* patients were aged over 55 years. For *Other non-acute care*, the majority of separations were for females (58.3%), and 68.5% (32,300) of all *Other non-acute care* separations were for people aged 75 years and over.

## Mode of admission

Mode of admission records the mechanism by which a patient begins an episode of care (Table 7.17).

In both public and private hospitals, most separations had a mode of admission of *Other* (94.5%, 7.4 million), the term used to refer to all planned and unplanned admissions except transfers from other hospitals and statistical admissions. Public hospitals recorded higher proportions of *Admitted patient transferred from another hospital* (227,300 or 4.8% of public hospital separations and 93,000 or 3.0% of private hospital separations). Public hospitals also reported higher proportions of *Statistical admission: type change* (64,000 or 1.3%) than were reported for private hospitals (21,000 or 0.7%). Among the states and territories, New South Wales had the highest proportion of separations with an admission mode of *Admitted patient transferred from another hospital* (5.1%).

## Mode of separation

The mode of separation records the status of the patient (discharged, transferred, care type change, died) at the time of separation and, for some categories, the place to which the person was discharged or transferred (Table 7.18). Due to changes in the definition for some of the categories over time and differences in the use of these definitions by jurisdictions, the use of some categories differs between jurisdictions. Consequently, the number of separations with a mode of separation of *Other* may be underestimated. As the reporting of the category *Discharge/transfer to residential aged care service* also differed over time for some jurisdictions, comparisons with mode of separation data from previous years should be treated with caution.

About 92% of separations (7.3 million) were included in the *Other* category, suggesting that most patients go home after their episode of care. This was particularly the case in the private sector, where 97.2% of separations (3.0 million) were categorised as *Other*, compared with 88.9% (4.2 million) in the public sector. More public hospital patients (6.1%) were transferred to other hospitals (acute and psychiatric) than was the case for private hospital patients (1.7%). There were also greater proportions of separations in the public sector for the categories *Died* and *Left against medical advice/discharge at own risk*.

There is a discrepancy between the number of patients reporting a mode of separation of *Discharge/transfer to an (other) hospital* (acute and psychiatric) (344,000; see Table 7.18) and the number of patients who recorded a mode of admission of *Admitted patient transferred from another hospital* (320,000; see Table 7.17). This may indicate that not all patients who are transferred from one hospital to another are having this recorded as their mode of admission, or that some patients were admitted and separated in different reporting years.

## Inter-hospital contracted patient status

An episode of care for an inter-hospital contracted patient (Table 7.19) is defined as an episode of care for an admitted patient whose treatment and/or care is provided under an arrangement between a hospital purchaser of hospital care and a provider of an admitted service and for which the activity is recorded by both hospitals (HDSC 2006). These data should be interpreted with caution as the activity reported here includes separations under contract between hospitals, but does not include separations under contract between private hospitals and the jurisdiction or between private hospitals and regional or area health services.

Contracted care was reported for 0.6% of separations (51,000). The total number of inter-hospital contracted patients was higher for private hospitals (36,100) than for public hospitals (14,700).

About 25.4% (3,700 separations) of contracted care provided by public hospitals was purchased by private hospitals. Almost 93% (33,500 separations) of contracted care provided by private hospitals was purchased by public hospitals.

As inter-hospital contracted patients are admitted patients of both the contracting and contracted hospital, these separations may represent double-counting of hospital activity in the National Hospital Morbidity Database.

## Urgency of admission

Tables 7.20 and 7.21 report on urgency of admission. This data element describes whether the admission was assigned an urgency status and, if so, whether the admission occurred on an emergency (admission should occur within 24 hours) or an elective basis. The table also includes information on whether the separations were considered to be *Surgical* or *Other*. These categories have been determined based on the *Surgical*, *Medical*, *Other* partitions of the AR-DRG classification. These partitions are generally assigned on the presence of operating room procedures for the *Surgical* partition and non-operating room procedures for the *Medical* and *Other* partitions (see Chapter 12). For this table, the category *Other* includes both the *Medical* and *Other* partitions of the AR-DRG classification.

For overnight separations, the majority of *Emergency* admissions were treated in the public sector (90.3%) and 60.6% of *Elective* admissions were treated in the private sector. For both the private and public sectors combined, 48.1% of overnight separations (1.7 million) were assigned an *Emergency* status, 38.8% of separations (1.3 million) were assigned an *Elective* status and the status was *Not assigned* for 12.9% of separations. In the public hospital sector, 62.8% of *Overnight* separations that were assigned an *Emergency* status and 13.5% of separations that were assigned an *Emergency* status were classified as *Surgical*. An *Emergency*

status was assigned for 15.1% of private hospital *Overnight* separations and 17.6% of these separations were classified as *Surgical* (Table 7.20).

For same-day separations, 96.3% of *Emergency* admissions were treated in the public sector and 55.4% of *Elective* admissions were treated in the private sector. For both the private and public sectors combined, 11.2% of same-day separations (496,000) were assigned an *Emergency* status, 72.6% of separations (3.2 million) were reported as *Elective* and the status was *Not assigned* for 16.0% of separations. In the private sector, 86.3% of separations were assigned an *Elective* status and 36.8% of these were classified as *Surgical* (Table 7.21).

## Hospital-in-the-home care

Table 7.22 reports on hospital-in-the-home care, and the number of days of hospital-in-the home care provided. Most states and territories have hospital-in-the-home programs under which admitted patients are provided with hospital care in the home. This care has been defined as occurring in the patient's (permanent or temporary) place of residence as a substitute for hospital accommodation, and within an episode of care for an admitted patient (HDSC 2006). For 2007–08, New South Wales and Tasmania did not report this data element.

For Victoria, Queensland, Western Australia and South Australia, there were 61,000 separations that reported hospital-in-the-home care. They accounted for 553,000 patient days, of which 384,000 days (69.5%) were reported as hospital-in-the-home days. Same-day separations accounted for 24.2% of separations (15,000) reporting hospital-in-the-home care for these states.

**Table 7.1: Separations and patient days<sup>(a)</sup>, by patient election status, funding source and hospital sector, Australia, 2003–04 to 2007–08**

	2003–04						2004–05						2005–06						2006–07						Average change in number of separations (per cent)

(a) Separations for which the care type was reported as *Newborn* with no qualified days, and records for *Hospital boarders* and *Posthumous organ procurement* have been excluded.

(b) Includes separations with a patient election status of *Public* and a funding source of *Australian Health Care Agreements*, *Reciprocal health care agreements*, *Other hospital or public authority*, *Other*, *No charge raised or Not reported*.

(c) Includes patients whose funding source was reported as *Australian Health Care Agreements* or *Other hospital or public authority*.

(d) Some states and territories were unable to identify all patients whose funding source may have been *Self-funded*; therefore the number of separations in this category may be underestimated.

(e) Includes separations with a patient election status of *Private* and a funding source of *Other compensation*, *Department of Defence*, *Correctional facilities*, *Other hospital or public authority*, *Other*, *No charge raised and Not reported*.

Note: These data should be interpreted with caution because of cross-border flows of patients. That is, patients may be treated in a state or territory other than their state or territory of residence, but separation rates are calculated using the Estimated Resident Populations for the state/territory of hospitalisation.

(a) Separations for which the care type was reported as *Newborn* with no qualified days, and records for *Hospital boarders* and *Posthumous organ procurement* have been excluded.

(b) Includes separations with a patient election status of *Public* and a funding source of *Australian Health Care Agreements* or *Other hospital or public authority*. *Other, No charge raised or Not reported*.

(c) Includes patients whose funding source was reported as *Australian Health Care Agreements* or *Other hospital or public authority*.

(d) Some states and territories were unable to identify all patients whose funding source may have been *Self-funded*; therefore the number of separations in this category may be underestimated and others may be overestimated.

(e) Includes separations with a patient election status of *Private* and a funding source of *Other compensation, Department of Defence, Correctional facilities, Other hospital or public authority*. *Other, No charge raised and Not reported*.

(a) Separations for which the care type was reported as *Acute*, or *Newborn* with qualified patient days, or was *Not reported*.

(b) Includes Cocos (Keeling) Islands, Christmas Island, Jervis Bay Territory.

(c) Includes resident overseas, at sea, no fixed address.

Note: Average cost weights have been calculated using AR-DRG version 5.1 public cost weights (2006–07) for the public sector and AR-DRG version 5.1 private cost weights (2006–07) for the private sector.

(a) Separations for which the patient election status was *Public* and for which the care type was reported as *Acute*, *Newborn* with at least one qualified day, or *Not reported* have been included. These data are based on the AR-DRG for each separation multiplied by the 2006-07 AR-DRG average public cost of \$3,722. These figures do not represent actual expenditure on these separations. These figures should also not be interpreted as an estimate of the total cost of public patients as they do not include estimates of costs for separations with non-acute care.

(b) ACT Health did not give permission for the release of these data because they do not reflect actual expenditure.

(c) Includes Cocos (Keeling) Islands, Christmas Island, Jervis Bay Territory.

(d) Includes resident overseas, at sea, no fixed address.

(a) Does not include records for *Hospital boarders* or *Posthumous organ procurement*.

(b) The reporting of *Newborns* with unqualified days only is not compulsory for the Victorian private sector, resulting in a low number of separations in this category.

(c) Tasmania and the Northern Territory did not supply *Newborn* care according to the *National health data dictionary* definition and did not report any separations with both qualified and unqualified days.

- (a) Does not include records for *Hospital boarders* or *Posthumous organ procurement*.
- (b) Rates per 1,000 population were directly age-standardised as detailed in *Appendix 1*.
- (c) The reporting of *Newborns* with unqualified days only is not compulsory for the Victorian private sector, resulting in a low number of patient days for this category.
- (d) Excludes unqualified days for *Newborns*, and includes *Not reported*.

(a) Includes separations for which the care type was reported as *Rehabilitation care*, *Palliative care*, *Psychogeriatric care*, *Geriatric evaluation and management or Maintenance care*.

(b) Unless this is the usual place of residence (see text for exceptions).

(c) Includes mothercraft hospitals, except in jurisdictions where mothercraft facilities are considered acute.

(d) Includes discharge to usual residence/own accommodation/welfare institution (including prisons, hostels and group homes providing primarily welfare services).

(e) Includes separations for which the mode of separation was *Not reported*.

(f) Includes separations for which the patient election status was *Public* and funding source was as *Australian Health Care Agreements*, *Reciprocal Health Care Agreements*, *Other hospital or public authority*, *Other*, *No charge raised or Not reported*.

(g) Includes separations for which the patient election status was not reported.

(h) Includes separations for which the care type was reported as *Psychogeriatric care*, *Geriatric evaluation and management or Maintenance care*.

(a) Includes separations for which the care type was reported as Rehabilitation care, Palliative care, Psychogeriatric care, Geriatric evaluation and management or Maintenance care.

(b) Unless this is the usual place of residence (see text for exceptions).

(c) Includes mothercraft hospitals, except in jurisdictions where mothercraft facilities are considered acute.

(d) Includes discharge to usual residence/own accommodation/welfare institution (including prisons, hostels and group homes providing primarily welfare services).

(e) Includes separations for which the mode of separation was Not reported.

(f) The total includes separations for which the sex/gender of the person was not reported.

(g) Includes separations where the care type was reported as Psychogeriatric care, Geriatric evaluation and management or Maintenance care.
