1 Introduction

These tables relate to all clients who were assisted in the July to December 2012 reporting period by specialist homelessness agencies based in the Northern Territory.

Further information about the Specialist Homelessness Services Collection is available in the national data report < <http://www.aihw.gov.au/homelessness-publications>>.

Client-level data

Data presented in these tables are mainly based on 'clients', with some data based on 'support periods' or 'client groups' (or 'presenting units' – which identify clients who present together to a specialist homelessness agency, including clients who present alone – and receive a service).

An individual client may have had more than one support period – either from the same agency or from a different agency. Data from individual clients who received services from different agencies and/or at different times are matched based on a statistical linkage key (SLK). All analyses based on client data include only those clients for whom full and valid SLK data (i.e. date of birth, sex, and alpha code based on selected letters of name) are available.

Clients who have more than one support period during July to December 2012 may present with different characteristics in these different support periods. For example, their main reason for seeking assistance may be 'domestic and family violence' in their first support period, and 'housing crisis' in the second. Where there are multiple responses to a question, some information presented is based on the client's response to the question at the beginning of their first support period in July to December 2012. Other information is based on a counting methodology that analyses the client's responses and, where these are different responses, determines the response provided most often and the client's longest support period for each month in July to December 2012.

Some tables are based on clients who had a closed support period in the reporting period. These are clients who did not have an ongoing support period in place at 31st December 2012.

Data in tables that are adjusted for non-response have had a weighting methodology applied which results in estimated figures that are not whole numbers. As a result, all figures in these tables are rounded to the nearest whole number and client numbers in separate columns may not add to the figure for 'all clients' due to rounding error.
