## 4 Resident characteristics

## Residents at 30 June 2005

There were 151,910 residents in residential aged care services at 30 June 2005, compared with 147,640 residents in aged care services at 30 June 2004 and 134,899 residents at 30 June 1999 (Tables 4.2 and A1.1). Around half ( $52 \%$ ) of the residents in aged care services at 30 June 2005 were aged 85 years and over. In 1999, $48.6 \%$ were aged 85 years and over (Table A1.1). This pattern was similar across the states and territories, with the exception of the Northern Territory where just $29 \%$ of residents were aged 85 years and over. Residents of services in remote and very remote areas tended to have a younger age profile, with $42 \%$ aged 85 years and over in remote areas and $28.8 \%$ aged 85 years and over in very remote areas (Table 4.5), the same proportions as at 30 June 2004.
Nationally, there were 6,628 residents aged under 65 years accommodated in aged care services, comprising $4.4 \%$ of all residents. For the Northern Territory, however, the proportion of residents aged under 65 years was considerably higher at $17.6 \%$ (Table 4.2). A higher proportion is to be expected given the higher proportion of Indigenous Australians in the Northern Territory. Aged care planning for Aboriginal and Torres Strait Islander people is based on those 50 years and over in light of their poorer health status. In remote areas, $10.0 \%$ of residents were under 65 years of age whilst in very remote areas $18.1 \%$ of residents were under 65 years of age. In other regions the representation of this age group was near the national average of $4.4 \%$ (Table 4.5).
The majority of residents (72\%) were female (Table 4.2). Female residents were on average older than male residents: $57 \%$ of female residents were 85 years of age or older, compared with $38 \%$ of male residents.

## Permanent residents

The majority ( $98 \%$ ) of residents in aged care services on 30 June 2005 were permanent residents $(149,091)$. Of these, $52 \%$ were aged 85 years and over and $72 \%$ of females were aged 85 years and over (Table 4.3).

## Marital status

About $98 \%$ of permanent residents reported their marital status prior to admission. Of these, $57 \%$ were widowed at the time of admission, $24 \%$ were either married or in a de facto relationship, $10 \%$ had never married and $7 \%$ were divorced or separated (Table 4.6). Female permanent residents were over twice as likely to be widowed and over two times less likely to be married or in de facto relationships than their male counterparts.
A lower proportion of permanent residents in the Northern Territory were widowed (50\%) than in any other jurisdiction, while a higher proportion of Northern Territory permanent residents were single ( $16 \%$ ) or separated ( $6 \%$ ).

## Indigenous status

Of the $94 \%$ of permanent residents for whom data were recorded on Indigenous status, 832 (about 0.6\%) identified as Indigenous people (Table 4.8). Only 57\% of Indigenous permanent residents were female compared with $72 \%$ of non-Indigenous residents.

The Northern Territory reported the highest proportion of Indigenous people among its permanent residents ( $37 \%$ ). Although Queensland recorded only $0.9 \%$ of permanent residents as having Indigenous status, it had the highest number of Indigenous residents (243).

## Pension status

A high proportion of permanent residents were in receipt of a government pension. Seventyone per cent of residents received a Centrelink pension and $17 \%$ an Australian Government Department of Veterans' Affairs pension (Table 4.10). Female permanent residents are more likely to receive a Centrelink pension ( $73 \%$ ) than males ( $68 \%$ ). On the other hand, a higher proportion of male residents receive a DVA pension $-21 \%$ of males receive this pension compared with $16 \%$ of women.
Self-funded retirees comprised $10 \%$ of permanent residents and there was little difference between males and females. The Australian Capital Territory had a higher proportion of self-funded retirees ( $21 \%$ ) among its permanent residents compared with other states and territories. The Northern Territory (4\%) and Tasmania (7\%) had the lowest proportion of self-funded retirees.

## Concessional and assisted residents

Residents with relatively low levels of income and assets are given assistance to access residential aged care. For residents who meet the eligibility criteria for concessional status, a concessional supplement is paid to the service provider, and the resident pays no accommodation charge or bond.
The supplement for assisted residents is lower, and, unlike a concessional resident, an assisted resident may be required to pay an accommodation bond or an accommodation charge subject to certain conditions. All residential aged care services are required to provide care to a minimum ratio or proportion of residents who are concessional or assisted. These ratios vary by aged care planning region.
At 30 June 2005, 36.7\% of permanent residents had concessional status and $3.5 \%$ were assisted. The Northern Territory had the highest proportion of concessional residents ( $68.3 \%$ ) followed by Western Australia ( $40.0 \%$ ). The Australian Capital Territory had the lowest proportion of concessional residents ( $32.4 \%$ ). The proportion of concessional residents was also higher in remote and very remote areas compared with major cities or regional areas (Tables 4.11 and 4.12).

## Country of birth and preferred language

Over $99 \%$ of all permanent residents had their birthplace and preferred language recorded. Of these, about $26 \%$ of residents were born overseas; $11 \%$ were born in the United Kingdom and Ireland, and another $10 \%$ in 'other ' areas of Europe (Tables 4.13).

Western Australia had the highest proportion of overseas-born permanent residents (38\%) and overseas-born respite residents ( $39 \%$ ) (Tables 4.13 and 4.14). Tasmania, Queensland and New South Wales had the lowest proportions of overseas-born permanent residents with $16 \%, 21 \%$ and $24 \%$ respectively.

Nationally, $91 \%$ of permanent residents indicated that English was their preferred language, while 7\% preferred other European languages (Table 4.15). Among permanent residents, the Northern Territory had the highest proportion preferring a language other than English, with $35 \%$ having this preference (including $25 \%$ who preferred an Australian Indigenous language) (Table 4.15). For the other states and territories, the proportion of those who reported a preferred language other than English ranged from $13 \%$ in Victoria to 3\% in Tasmania.

## Respite residents

Only 2,819 residents in aged care services on 30 June 2005 were receiving respite care, representing just under $2 \%$ of all residents (Table 4.4). The age profile of respite residents was younger than that of permanent residents. Only $42 \%$ of respite residents were aged 85 years and over, with a further $42 \%$ aged between 75 and 84 years. A lower proportion of respite residents were female ( $64 \%$ ) compared with permanent residents ( $72 \%$ ).
The age-sex profile of respite residents varied across states and territories. In the Northern Territory, $17 \%$ of respite residents were aged under 65 years and only $25 \%$ were aged 85 years and over. The age profile of respite residents was oldest in Tasmania where $51 \%$ of respite residents were aged 85 years and over.
For those where marital status was recorded, a higher proportion of respite residents were either married or in a de facto relationship ( $32 \%$ ) compared with permanent residents ( $24 \%$ ) (Tables 4.6 and 4.7). A smaller proportion of respite residents compared to permanent residents were widowed, but this group still comprised more than half of respite residents (55\%).
Indigenous status was not reported for $1.1 \%$ of respite residents. Of those for whom Indigenous status was reported, $1.2 \%$ identified as Indigenous people (Table 4.9).
Twenty-eight per cent of respite residents were born overseas and their country of birth profile was similar to that for permanent residents. Nationally $88 \%$ of respite residents indicated that English was their preferred language, while 9\% preferred other European languages, especially Southern European languages (Tables 4.14 and 4.16).

## Newly admitted residents 2004-05

There were 51,475 people admitted at least once to residential aged care services for permanent care during 2004-05 (Table 4.20), and 34,312 people were admitted for respite care during the same period (Table 4.21).
People admitted for respite care were slightly younger than those admitted for permanent care, with $65 \%$ of respite admissions aged 80 years and over compared with $70 \%$ of permanent admissions (Tables 4.18 and 4.19). There has been an increase in the proportion of newly admitted residents aged 80 years and over since 1998-99, when $60 \%$ of people admitted for respite care and $64 \%$ of people admitted for permanent care were aged 80 years and over (Table A1.2).

Admitted permanent residents were more likely to be married or in a de facto relationship (30\%), when compared with all permanent residents at 30 June 2005 ( $24 \%$ ) (Tables 4.6 and 4.20). While the vast majority of people admitted for both permanent and respite care were either married or widowed, those admitted for respite care were more likely to be married than those admitted for permanent care ( $35 \%$ and $30 \%$ respectively) (Tables 4.20 and 4.21 ).
A high proportion of newly admitted residents had been living in a house or flat prior to admission during the reporting period: $74 \%$ of permanent residents and $83 \%$ of respite residents for whom these data was reported (Tables 4.22 and 4.23).
For those residents where information about prior outside living arrangements were relevant and available, $49 \%$ of admitted permanent residents lived alone prior to their admission, $45 \%$ lived with family and $6 \%$ lived with others (Table 4.24). It should be noted that the introduction of a new ACAT form in 2003 means it is no longer possible to identify those who lived only with their spouse. Residents admitted for respite care differed considerably from those admitted for permanent care with regard to their living arrangements. Those admitted for respite care were more likely, at the time of admission, to be living in the community than were permanent residents. While residents admitted for respite care were less likely to be living alone than those admitted for permanent care, it is noteworthy that $38 \%$ of respite admissions were for people living alone at the time of entry (Table 4.25). This was particularly true of women: $46 \%$ of women admitted for respite were living alone compared with $25 \%$ of men.
The proportion of newly admitted permanent residents who were receiving an Australian Government Department of Veterans' Affairs pension was higher at 19\% than for all permanent residents at 30 June $2005(17 \%)$. The corresponding proportions of people receiving a Centrelink pension were $68 \%$ and $71 \%$ respectively (Tables 4.10 and 4.26).

## Dependency levels

Resident dependency levels are indicated by the Resident Classification Scale (RCS). The RCS has eight categories which represent eight levels of care in descending order of need from 1 to 8 . The level of Australian Government care subsidy is based on the level of care need indicated by each RCS category. No basic subsidy is paid for residents in category RCS
8. Categories 1 to 4 represent high care status and categories 5 to 8 represent low care status.

Among permanent residents on 30 June 2005, 1,180 ( $0.8 \%$ ) did not have an assessment recorded on the database. Of those who did have their dependency level reported, $67 \%$ were in high care categories (RCS 1 to 4 ) and $33 \%$ in low care categories (RCS 5 to 8 ). RCS categories 1,2 and 3 comprised the highest proportion of permanent residents ( $22 \%, 25 \%$ and $15 \%$ respectively). The lowest level of care (RCS 8) contained $0.6 \%$ of residents at 30 June 2005 (Table 4.28).
Tables 4.29 and 4.30 both examine resident dependency at 30 June 2005 but one table focuses on younger ages and the other on older ages. There were few differences between male and female residents in relation to dependency levels. A higher proportion of young residents were classified as high dependency. For example, $38 \%$ of residents aged under 40 years were classified RCS 1 compared with $23 \%$ of those over 65 years.
Between 30 June 1998 and 30 June 2005, there was a consistent increase in the proportion of residents classified as high care (RCS 1 to 4 ) from $58 \%$ to $67 \%$, while the proportion of those classified as low care (RCS 5 to 8 ) fell from $42 \%$ to $33 \%$ (Table 4.1). This decline has been
most marked in RCS 8, reflecting an increasing emphasis on providing services to those with personal care needs, rather than primarily accommodation needs. From 1998 to 2005 the proportion in RCS 8 has dropped from $4.5 \%$ to $0.6 \%$ and the proportion in other low care (RCS 5-7) has dropped from $37.7 \%$ to $31.9 \%$ (Table 4.1). Available residential care places have thus been targeted to a progressively more dependent group of people. During this same period the supply of Community Aged Care Packages, aimed at providing the equivalent of low care residential support to people still living in their own homes, has expanded significantly. This pattern is in keeping with established government policy which aims to provide a greater proportion of care for people in their homes who would otherwise be eligible for low care residential support.

Table 4.1: Dependency levels of permanent residents in residential aged care services, 30 June 1998 to 30 June 2005 (per cent)

| Sex/year | RCS 1-RCS 4 high care | RCS 5-RCS 7 <br> funded low care | RCS 8 <br> nil basic subsidy | RCS 5-RCS 8 low care |
| :---: | :---: | :---: | :---: | :---: |
| Females |  |  |  |  |
| 1998 | 57.1 | 38.4 | 4.5 | 42.9 |

| 2003 | 64.4 | 34.6 | 1.0 | 35.6 |
| 2004 | 65.6 | 33.6 | 0.8 | 34.4 |
| 2005 | 67.5 | 31.9 | 0.6 | 32.5 |

Sources: AIHW 2005 and Table 4.28.

The dependency profile of newly admitted residents during 2004-05 provides a useful indication of possible future trends in residential care. The dependency levels of admitted permanent residents during the period suggest that we may expect similar proportions of people in residential aged care at high care levels in the future. After excluding the 2,557 residents whose dependency levels were not available, $63 \%$ of admitted permanent residents were classified as high care and $37 \%$ as low care (Table 4.27). The proportion of
those admitted as high care residents is lower than for existing residents (67\%), as admitted residents are by definition at the beginning of their residential aged care stay - some will progress to higher levels of dependency in the course of their stay.
As would be expected, the dependency levels of residents who left residential care were much higher than those for both current and admitted residents (Table 4.32). Eighty-five per cent who left permanent care during 2004-05 were classified as high care residents.

Increasing dependency during residential aged care stay is apparent when we consider that $19 \%$ of new admissions were categorised as RCS 1, but $22 \%$ of current residents at the end of June 2005 were in the RCS 1 category, and $36 \%$ of separations during that year were in that category.

(a) Refers to the location of the services.

Notes:

1. 'DVA' refers to the Australian Government Department of Veterans' Affairs. Other pensions are administered by Centrelink.
2. The category 'Unknown' refers to residents not yet assessed by Centrelink or DVA at the time of reporting.
3. The table supplied by the Australian Government Department of Health and Ageing (DoHA) has been adjusted slightly to retain consistency with other tables as different updates of the data were used (see Appendix 3).

[^11]:    (a) Refers to the location of the services.

[^12]:    (a) Characteristics are for the last permanent admission in the period. Transfers are excluded.
    (b) Refers to the location of the services.

[^13]:    (a) Characteristics are for the last respite admission in the period. Transfers are excluded.
    (b) Refers to the location of the services.

[^14]:    (a) Characteristics are for the last permanent admission in the period.Transfers are excluded.
    (b) Refers to the location of the services.

[^15]:    (a) Characteristics are for the last respite admission in the period. Transfers are excluded.
    (b) Refers to the location of the services.

[^16]:    (a) Characteristics are for the last permanent admission during the period. Transfers are excluded.
    (b) Refers to the location of the service.

[^17]:    (a) Characteristics are for the last respite admission during the period. Transfers are excluded.
    (b) Refers to the location of the service.

[^18]:    (a) Each person is counted once regardless of the number of admissions the resident had during the period. The status at the first admission is reported.
    (b) Refers to the location of the services.

    Notes:
    1 'DVA' refers to the Australian Government Department of Veterans' Affairs. Other pensions are administered by Centrelink.
    2. The table was supplied by DoHA and has been adjusted to retain consistency with other tables in the section.
    3. The category 'Unknown' refers to clients not yet assessed by DVA or Centrelink.

[^19]:    (a) Each person is counted once regardless of the number of separations during the period. The RCS is associated with the last separation in the reporting period.
    Note: This table excludes 591 residents whose dependency levels were not reported at separation.

[^20]:    (a) Each person is counted once regardless of the number of separations the resident has during the period. The last length of stay is the length of stay evaluated from the last separation in the period. Transfers are not regarded as separations.
    Note: This table excludes 591 residents whose dependency levels were not reported.
